RE: Assessment and Work Plan for the (Arch) Pogo Producing Company, Manda B Tract C Tank Battery located in Section 28, Township 22 South, Range 37 East, Unit Letter C, Lea County, New Mexico.

Dear Mr. Johnson:

Highlander Environmental Corp. (Highlander) was contacted by (Arch) Pogo Producing Company to assess a spill on the Manda B Tract C Tank Battery located in Section 28, Township 22 South, Range 37 East, Unit Letter C, Lea County, New Mexico (Site). The State of New Mexico C-141 (Initial) is shown in Appendix A. The Site is shown in Figure 1.

Background

According to the State of New Mexico C-141 report, the spill occurred on September 22, 2003 from an overflow of an oil tank. The facility had no firewall constructed around the tanks. An unknown volume of oil was released and 3 barrels of oil was recovered. The fluids from the release flowed to the southwest corner of the battery and then flowed down the lease road. The impacted area at the battery measured approximately 15' x 30' and the area on the lease road measured approximately 325' long by 1' to 2' wide. The spill areas on the pad and lease road were immediately back dragged with a backhoe. The spill areas are shown on Figure 2.

Groundwater and Regulatory

According to published data from "Geology and Groundwater Resources of Lea County, New Mexico", dated 1952, one water well with a water level of 66.1' was reported in Section 28, Township 22 South, Range 37 East. The New Mexico State Engineer Office database did not show any wells in Section 28, Township 22 South, Range 37 East. However, several wells were reported in the surrounding Sections, with average depth to groundwater of 65' (Section 21), 65' (Section 26) and 60' (Section 34). The well records are shown in Appendix B.

Pogo - 17891
facility - fPA C0605332835

incident - nPA C0605332930
application - pPA C0605333131

A risk-based evaluation was performed for the Site in accordance with the New Mexico Oil Conservation Division (NMOCD) Guidelines for Remediation of Leaks, Spills and Releases, dated August 13, 1993. The guidelines require a risk-based evaluation of the site to determine recommended remedial action levels (RRAL) for benzene, toluene, ethylbenzene and xylene (collectively referred to as BTEX) and total petroleum hydrocarbons (TPH) in soil. The proposed RRAL for benzene was determined to be 10 parts per million (ppm) or milligrams per kilogram (mg/kg) and 50 ppm for total BTEX (sum of benzene, toluene, ethylbenzene and xylene). Based upon the depth to groundwater, the proposed RRAL for TPH is 1,000 mg/kg.

Assessment

On September 24, 2003, Highlander personnel installed an auger hole using a stainless steel bucket-type hand auger to evaluate and attempt to delineate the extent of impacted soil. The auger hole was placed inside the tank battery fence line. Soil samples were collected at depths of 0-1' and 2-2.5', 4-4.5', 5-5.5' and 6.5' below surface for TPH evaluation by method 8015M, BTEX by method 8021B and chloride by method SW 846-9252. The soil sample results are shown in Table 1. The laboratory reports and the chain of custody documentation are included in Appendix C.

Soil Sample Results

Referring to Table 1, the sample at 0-1', exceeded the RRAL for TPH and total BTEX with TPH at 25,440 mg/kg and total BTEX at 503.5 mg/kg. The deeper sample at 2-2.5' showed TPH to be below the method detection limit.

The chloride concentrations decreased from a high of 10,600 mg/kg at 4-4.5' and 5-5.5' to 3,100 mg/kg at 6-6.5'. Deeper samples could not be collected due to the dense, caliche formation. The chloride impact appears to be from older spills from the tank battery.

Conclusions and Recommendations

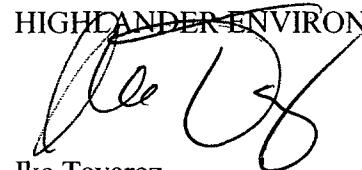

The hydrocarbon evaluation at the Site indicated a shallow impact with concentrations decreasing to below the method detection limit at a depth of 2.0' below surface. Based on the TPH analysis at 2.0' below surface, the BTEX would not be a concern at this depth. The chloride detected appears to be from older spills. The concentrations were elevated, however, declined significantly with depth. Deeper samples could be collected due to a dense, caliche formation.

Pogo proposes excavating the impacted soils from surface to approximately 6.0' below surface and dispose of these soils at Sundance Services, Inc. located in Eunice, New Mexico. Due to the tank location, the area of excavation is estimated at 12' x 15'. Once completed, soil samples will be collected with the backhoe in the excavation bottom and to attempt to vertically define extent of the chloride impact.

If you require any additional information or have any questions or comments concerning the assessment report, please call.

HIGHLANDER ENVIRONMENTAL CORP,

Ike Tavarez
Project Manager/Geologist

CASE NARRATIVE

ENVIRONMENTAL LAB OF TEXAS

Prepared for:

HIGHLANDER ENVIRONMENTAL CORP.
1910 N. BIG SPRING STREET
MIDLAND, TX 79705

Order#: G0307584

Project: Pogo/Arch-Manda B- Tract C.

The following samples were received as indicated below and on the attached Chain of Custody record. All analyses were performed within the holding time and with acceptable quality control results unless otherwise noted.

SAMPLE ID	LAB ID	MATRIX	Date Collected	Date Received
AH-1 0-1'	0307584-01	SOIL	09/24/2003	09/26/2003
AH-1 2-2.5'	0307584-02	SOIL	09/24/2003	09/26/2003
AH-1 4-4.5'	0307584-03	SOIL	09/24/2003	09/26/2003
AH-1 5-5.5'	0307584-04	SOIL	09/24/2003	09/26/2003
AH-1 6-6.5'	0307584-05	SOIL	09/24/2003	09/26/2003
AH-1 1.0-1.5'	0307584-06	SOIL	09/24/2003	09/26/2003

Surrogate recoveries on the BTEX are outside control limits due to matrix interference. (0307584-01)

The enclosed results of analyses are representative of the samples as received by the laboratory. Environmental Lab of Texas makes no representations or certifications as to the methods of sample collection, sample identification, or transportation handling procedures used prior to our receipt of samples. To the best of my knowledge, the information contained in this report is accurate and complete.
