Downhole Commingling Allocation Method
On the San Juan 29-6 Unit #86

Dear Sirs:

Phillips Petroleum is proposing to utilize the subtraction method on the subject well for approximately twelve months after actual commingling occurs. After the 12th month period we will convert to the ratio method as indicated in our commingling application. We believe this will be a more accurate method of allocating production considering the Dakota interval has been producing for years and that the production will not be stabilized on the Mesaverde for several months.

Dakota Production Forecast

December 1999	2,165	January 2000	2,156
February 2000	1,940	March 2000	2,139
April 2000	2,061	May 2000	2,121
June 2000	2,044	July 2000	2,104
August 2000	2,095	September 2000	2,019
October 2000	2,078	November 2000	2,002

For example, if the total volume for December 1999 were 16,115 mcf, then the Dakota would be allocated 2,165 mcf and the Mesaverde 13,950 mcf. And subsequently, the Dakota would be allocated $(2,165/16,115)$ or 13.43% and the Mesaverde would be allocated $(13,950/16,115)$ or 86.57%.

Sincerely,

Production Allocation Methodology

◆ Adding New Zone to Existing Zone - Initially Subtraction Method followed by Fixed Allocation Method

- Subtraction Method (+/- 1st 12 months)
 - Forecast production rate by month for existing zone utilizing established decline curve for zone
 - Subtract forecasted rate from commingled rate to define new zone rate
 - Utilize subtraction method for +/- 12 months until new zone rate stabilizes, then utilize fixed allocation method with current rates
- Fixed Allocation Method (after Subtraction Method)
 - Utilize forecasted rate from established decline curve for lower zone
 - Calculate upper zone rate by subtracting lower zone rate from commingled rate
 - Lower zone allocation = $\frac{\text{Lower zone rate}}{\text{Commingled rate}}$
 - Upper zone allocation = $\frac{(\text{Commingled rate} - \text{Lower zone rate})}{\text{Commingled rate}}$
