General Description		-						e program. After	
former junction site using	g a backhoe to col	lect soil samp	les , creating	a 10 x 8 x 7-ft-	deep hole. Ch	nloride field te	sts were condu	ucted on each of t	he
samples and yielded rela	atively low concent	rations. Orga	nic vapors we	ere also measu	red in the field	l using a PID	and those con	centrations were	also very
low. Composite samples	s from the final exc	avation were	collected for I	aboratory anal	ysis. These re	esults confirm	ed field tests a	nd that TPH cond	centrations
meet NMOCD guidelines	s. The excavated	soil was blend	led on site an	d returned to t	ne hole and co	ntoured to the	e surrounding :	surface. On 3/6/	2007
the disturbed area was s	eeded with a blen	d of native veg	getation and is	s expected to r	eturn to produc	ctive capacity	at a normal ra	te.
