RE: Report of Groundwater Remediation Activities
Bell Lake Plant Remediation Site
Transwestern Pipeline Company
Lea County, New Mexico
Case # GW-355

Dear Glenn,

The enclosed Report of Groundwater Remediation Activities is submitted for your review and files. This report presents a summary of groundwater monitoring and remediation activities completed during 2008.

If you have any questions or comments regarding this report, please contact me at (281) 797-3420.

Sincerely,

A handwritten signature in cursive script that reads "George Robinson".

George Robinson
President/Principal Engineer

1. Groundwater Monitoring Activities

1.1 Semi-Annual Groundwater Sampling Events

Two semi-annual groundwater sampling events have been completed during the reporting period. These events were completed in May 2008 and December 2008.

Prior to sampling, the depth to water, and the depth to hydrocarbon where phase-separated hydrocarbons (PSH) were present, was determined for each monitoring well. The measured depth to water and the corresponding water table elevation for each monitoring and SVE well is presented in Table 1.

In the course of each sample event, groundwater samples were collected from selected monitoring and SVE wells at the site. In addition, groundwater samples were collected from the on-site water well. Samples were not collected from wells with accumulated PSH in the well casing. Groundwater samples were delivered to a laboratory for analysis for benzene, toluene, ethylbenzene, and xylene (BTEX) by EPA Method 8021B, selected metals by EPA Method 6010B, total dissolved solids (TDS) by SM 2540C, and chlorides by EPA Method 300.0.

A summary of laboratory results for organics and field measured groundwater quality parameters (pH, temperature, electrical conductivity and dissolved oxygen) is presented in Table 2. A summary of laboratory results for inorganics is presented in Table 3. A copy of the laboratory reports for each of the sampling events is included as an attachment to this report.

1.2 Results/Conclusions from Groundwater Sampling Events

1.2.1 Occurrence and Direction of Groundwater Flow

A water table elevation map based on measurements obtained in the course of the December 2008 sampling event is included as Figure 2. The apparent direction of groundwater flow is consistent with water table elevation maps previously developed for this site.

Hydrographs for selected wells have been included as an attachment to this report. For wells that have contained accumulated PSH in the well casing, the thickness of PSH measured in the well is also presented with the hydrograph.

1.2.2 Lateral Extent of Phase Separated Hydrocarbon

The lateral extent of PSH is currently defined by the occurrence of PSH at the water table in wells MW-4, SVE-3, SVE-8 and SVE-13 and the absence of PSH in all other wells. The thickness of accumulated PSH in wells is presented in Table 1. A figure indicating the estimated area with PSH present at the water table is included as Figure 3.

The thickness of PSH accumulated in wells has decreased significantly since remediation efforts began in 1996. For example, 3.54 feet of PSH was measured in well SVE-3 in May 1996. This was reduced to no measurable thickness in the well by August 2000. Since then, the amount of PSH accumulated in the well has slowly increased to 0.10 feet as measured in December 2008, but still significantly less than that originally measured in the well. Similar reductions in the amount of measurable PSH has been documented in wells SVE-1, SVE-4, SVE-9, SVE-10, and SVE-12. In recent years, a significant thickness of PSH has persisted in just two wells, wells

SVE-8 and SVE-13, where in December 2008, PSH was measured at 1.04 feet and 1.43 feet, respectively.

The reduction of PSH accumulated in wells is an indication that the soil vapor extraction system has effectively been removing PSH from the subsurface.

1.2.3 Condition of Affected Groundwater

Elevated concentrations of benzene, TDS, and chlorides continue to be the primary constituents of concern at the site. The distribution of BTEX constituents dissolved in groundwater is presented in Figure 4. The distribution of inorganic constituents dissolved in groundwater is presented in Figure 5. The condition of affected groundwater has not changed significantly from previous sampling events as evidenced by the data presented in Tables 2 and 3. Concentration history plots for selected wells are included as an attachment to this report. The plots were prepared using concentration data presented in Tables 2 and 3.

2. Status of Remediation Activities

2.1 Remediation Activities Completed through December 2008

The following remediation activities have been completed since the last report of groundwater remediation activities:

- 1) The SVE system operated continuously during the 12 month reporting period except for brief shutdowns for system maintenance. Based on the laboratory results for the SVE sample collected on July 1, 2008, the SVE system is removing natural gas condensate from the ground at an estimated rate of 350 gallons equivalent per year.
- 2) The PSH recovery system was shut down on May 20, 2008 and will be restarted after repairs are made to the recovery well pumps.

3. Proposed Modifications

3.1 Modifications to the Routine Groundwater Sampling Plan

Sampling location, frequency and the sampling analysis plan will continue on a semi-annual basis. A summary of the sample analysis plan is presented in Table 6.

3.2 Modifications to the Remediation System

Currently, the liquid recovery system consists of five pneumatic PSH skimming pumps. This system was taken out of service in May 2008 in order to make repairs to the pumps and to evaluate the need for continued operation of the liquid recovery system. Presently, it appears that the SVE system is much more effective than the liquid recovery system in removal of PSH from the subsurface. Furthermore, only two wells currently contain an accumulation of PSH that is great enough to effectively utilize the PSH skimming pumps.

In April 2004, a Discharge Plan application was submitted to the OCD for an expansion of the remediation system to include total fluids (both PSH and water) recovery from the perched aquifer. The proposed modification would replace the skimming pumps with five pneumatic total

fluids pumps. The objective is to more aggressively recover PSH and contaminated groundwater present near the release area. On October 25, 2004, Discharge Plan GW-355 was issued by the OCD for this modification.

An integral part of the system expansion was to include the installation of an evaporation pond for management of recovered groundwater. The evaporation pond was designed to have an effective water surface area of about one acre. Since there is not sufficient area available within the Bell Lake Plant facility for this installation, the pond would be constructed on adjacent property. The adjacent property is owned by the State of New Mexico and administered by the State Land Office. The State Land Office has requested a remediation alternative analysis prior to entering into a lease access agreement for construction of the evaporation pond. More specifically, the State Land Office requested that alternatives should include off-site disposal and deep well injection.

Transwestern has not yet completed the remediation alternative analysis, however, a fourth alternative that includes water treatment by reverse osmosis (RO) is currently being evaluated. With this option, only reject water from the RO unit would require off-site disposal.

Transwestern intends to complete the alternative analysis and have the liquid recovery system installed and in operation by mid-year 2009. If necessary, Transwestern will amend the existing Water Development Easements and/or enter into a lease access agreement with the State Land Office in order to implement the liquid recovery system.

3.3 Reporting Frequency

Annual reporting will continue with the next scheduled report being submitted to the OCD by February 28, 2010.

NOTES:

- (a) Not applicable since no measurable thickness of hydrocarbon is present
- (b) Corrections to ground water surface elevation for presence of hydrocarbon is calculated assuming a specific gravity of 0.8
- (c) TOC elevation based on survey by John West Surveying Co. on 12/28/95
- (d) TOC elevation based on survey by CES (GCR) on 01/09/98
- (e) TOC elevation based on survey by CES (GCR) on 08/11/99
- (f) TOC elevation based on survey by John West Surveying Co. on 12/27/99
w/adjustments: MW-2=+0.06, MW-7 & SVE-1-13=+0.08, MW-10-13=+0.02
- (g) TOC elevation based on survey by John West Surveying Co. on 01/09/03

RE: TWP Bell Lake

Order No.: 0812268

Dear George Robinson:

Hall Environmental Analysis Laboratory, Inc. received 23 sample(s) on 12/13/2008 for the analyses presented in the following report.

These were analyzed according to EPA procedures or equivalent. Below is a list of our accreditations. To access our accredited tests please go to www.hallenvironmental.com or the state specific web sites.

Reporting limits are determined by EPA methodology. No determination of compounds below these (denoted by the ND or < sign) has been made.

Please don't hesitate to contact HEAL for any additional information or clarifications.

Sincerely,

A handwritten signature in black ink, appearing to read "Andy Freeman".
