RE: 3rd Quarter 2009 Groundwater Monitoring Results
DCP Eldridge Ranch Study Area (AP#-33)
Unit P, Section 21, Township 19 South, Range 37 East
Lea County, New Mexico

Dear Mr. Lowe:

DCP Midstream, LP (DCP) is pleased to submit for your review, a one copy of the 3rd Quarter 2009 Results for the DCP Eldridge Study Area located near Monument, New Mexico (Unit P, Section 21, Township 19 South, Range 37 East).

If you have any questions regarding the report, please call at 303-605-1718 or e-mail me swweathers@dcpmidstream.com .

Sincerely

DCP Midstream, LP

Stephen Weathers, P.G.

Subject: Third Quarter 2009 Groundwater Monitoring Report
DCP Midstream, LP Eldridge Ranch Study Area, Lea County, New Mexico
Unit P, Section 21, Township 19 South, Range 37 East **(AP-33)**

Dear Steve:

This letter summarizes the activities completed and data generated and provides conclusions and recommendations for the third quarter 2009 groundwater-sampling event at the DCP Midstream, LP (DCP) Eldridge Ranch Study Area. The study area is located approximately 1 mile north and 0.75 miles east of the town of Monument in Lea County New Mexico (Figure 1). The New Mexico Oil Conservation Division (OCD) location descriptor is Unit P, Section 21, Township 19 South, Range 37 East. The coordinates for the location are 32.642 degrees north, 103.256 degrees east.

FIELD PROGRAM DESCRIPTION

The groundwater monitoring activities were completed on September 21, 2009 and September 22, 2009. All activities followed the protocols included in the Sampling and Analysis Plan (SAP) that was prepared for this project and approved by the OCD. The well locations are shown on Figure 2. Table 1 provides construction information for the wells.

The groundwater monitoring activities are divided into water table measurement, free phase hydrocarbon thickness measurements and groundwater sampling. The activities completed and the data generated are summarized below.

Water Table Measurement

The fluid levels were measured prior to purging each well. Wells that contained FPH were not sampled. The fluid measurement data are summarized in Table 2. All of the historical corrected water table elevation data are included in Attachment A.

Approximate corrected water-table elevations for the wells containing FPH were estimated using the following formula:

GWE_{corr} = MGWE + (FPHT*PD): where

- MGWE is the actual measured groundwater elevation;
- FPHT is the measured free-phase hydrocarbon thickness; and
- PD is the FPH density (assumed at 0.72 based upon site data).

Hydrographs for select wells are included in Figure 3. The hydrographs indicate that the water table continued to decline at a uniform rate across the site.

Water table contours based upon the corrected data are shown in Figure 4. The contours were generated using the Surfer® program and modified based upon site-specific considerations. This figure is discussed below in the conclusions section. The 3.62-foot head difference between MW-1 and MW-1D (Table 2) falls slightly above the historic range of 3.52 to 3.59 feet.

Free Phase Hydrocarbon Thickness Measurements

The FPH thickness measurements are summarized on Table 3. FPH recovery ceased one week before the measurements to ensure accurate readings. Wells MW-26, MW-27 and MW-CC contained FPH. The current thicknesses all remain at or below 0.66 feet (8 inches).

FPH thickness over time is plotted on Figure 5 for the above three wells. Well MW-CC continues to remain within its historic thickness range. The FPH thickness in wells MW-26 and MW-27 have remained in the same range of 0.66 to 0.72 feet for the past year.

Groundwater Sampling and QA/QC Analysis

Representative groundwater samples were collected from 50 wells. The remaining wells either contained FPH or are used only for groundwater level measurement.

Every well except the house well and the irrigation well was purged using a dedicated bailer. Purging continued until a minimum of three casing volumes of water was removed and the field parameters temperature, pH and conductivity stabilized. The house well and irrigation well were purged using a submersible pump. The affected purge water was disposed of at the DCP Linam Ranch facility.

All samples were placed in ice-filled chests immediately upon collection and shipped to the Accutest Laboratory in Houston Texas using standard chain-of-custody protocols. The unfiltered samples were analyzed for benzene, toluene, ethylbenzene and total xylenes (BTEX) using EPA Method 8260B.

The BTEX results for the monitoring episode are summarized in Table 4. The historic BTEX data are summarized in Attachment B. The laboratory report is included in Attachment C. Constituents that exceed the New Mexico Water Quality Control Commission (NMWQCC) groundwater standards are highlighted as bold text.

The QC evaluations included:

- There were no constituents detected in the trip blank;
- The method blanks results were all nondetect;
- The blank spikes were all within their acceptable ranges;
- The matrix spike/matrix spike duplicates were all within their control ranges with the exception of one sample that had a concentration that was higher than the spike amount (ethylbenzene, MW-MM)
- All of the applicable individual surrogates were within their ranges; and
- The relative percentage difference values for the duplicates with detected results were acceptable.

The quality control evaluations verify that the data are suitable for their intended use of routine groundwater monitoring evaluation.

The benzene concentrations and the calculated isopleths are shown on Figure 6. The isopleths were generated using the Surfer® program with a kriging option and then modified to accurately define the site-specific conditions. The distributions are discussed below.

CONCLUSIONS

The interpretations and conclusions are grouped according to groundwater flow, FPH thickness, spatial benzene distribution and temporal benzene distribution.

Groundwater Flow

The groundwater flow pattern for this monitoring event reflects conditions that have generally been present over most of the site history, including:

1. The water table gradient increases south of the boundary between the Huston and the DCP-Eldridge Properties (Figure 4). An area with a flatter gradient is present in the center of the Huston property between groundwater contours 3606 and 3608 feet.

2. The groundwater flow north of MW-22 is generally southward. The groundwater flow then deflects toward the southeast in the southern half of the study area (Figure 4). This pattern reflects the alignment of the surface drainage.

3. The groundwater low associated with MW-15 and, to a lesser extent, MW-14 has stabilized after a year of transition. The area is localized, and does not affect the regional groundwater flow pattern. The low at MW-A is an historical anomaly that has been present from the start of the project.

Free Phase Hydrocarbon Thickness

Conclusions related to FPH for this monitoring event include:

1. The FPH thickness decreased slightly in MW-27 for the fourth quarter while rebounding slightly in MW-CC. The thickness has decreased by approximately 0.25 feet in both MW-27 and MW-CC since regular removal was initiated in August 2007. The thickness in both wells remains less than 0.75 feet.

2. The thickness in MW-26 rebounded for the second consecutive quarter; however, the thickness remains below 0.25 feet.

3. Less than 0.1 gallon of FPH is removed weekly from each of the above three wells due to the thinness and relative immobility of the FPH. More aggressive removal is not warranted given these nominal volumes.

Spatial Benzene Distribution

Conclusions on the spatial benzene distribution that are derived from the Figure 6 isopleth map include:

1. The plume labeled North Area on Figure 6 is physically separated from the other plumes. The part of the plume that exceeds the NMWQCC groundwater standards may now be limited to the State land.
2. A plume in the central area that appears to originate from the area of MW-26 is naturally attenuating along an alignment that includes MW26 (FPH), MW-EE (0.995 mg/l), MW-23 (0.129 mg/l) and MW-MM (0.0226 mg/l).
3. Another separate plume in the central area that includes MW-27, MW-LL, MW-CC, MW-N, MW-O, MW-Q, MW-M, MW-12 and MW-11 probably resulted from multiple non-DCP releases. This plume is elongated toward the southeast and it attenuates to below the NMWQCC groundwater standard in the middle of the Huston property at or near MW-8.
4. There were no exceedances of the NMWQCC groundwater standard south of MW-8. This area includes the approximate southern one-third of the Huston property and all of the DCP Eldridge property.
5. There is no evidence of dissolved phase hydrocarbon plume expansion. In fact, the down-gradient boundaries of the dissolved-phase benzene appear to be contracting as discussed below.

Temporal Benzene Distribution

The site is broken into three areas as shown on Figure 2 to facilitate discussion of the temporal benzene distributions. The evaluation begins with the north (former NMG) area and then moves to the central area. The south area, discussed last, includes the southern part of the Huston property and the DCP-Eldridge property.

Benzene-time graphs for select wells in the three areas were updated and evaluated for indications of dissolved phase hydrocarbon plume expansion. The historic benzene data used to generate these plots are summarized in Attachment B.

North Area

Time-benzene plots for the north area are shown on Figure 7. Down-gradient monitoring wells NMG MW-11 and NMG MW-13 are not included because no BTEX constituents have ever been detected in them. The benzene concentration has remained below the 0.002 mg/l method-reporting limit in NMG MW-9 since September 2007 and in NMG MW-8 since September 2008.

Wells NMG MW-5 is the closest well to the source area along the groundwater flow path. Its benzene concentration declined slightly from May 2009 to September 2009. The benzene concentrations in NMG MW-10 remained stable, and the concentration increased in MW-7.

The benzene concentration in NMG MW-6, located along the eastern edge of the northern part of the plume, continues to decline at a rapid rate for the fourth consecutive monitoring event, and it is now below the NMWQCC groundwater standard. Benzene is also declining in NMG MW-12 at the southern edge of the plume, and the concentration remained below the NMWQCC Groundwater Standard for the second quarterly event.

The trends described above demonstrate that the dissolved phase hydrocarbon plume is contracting. This contraction directly results from the historic soil remediation activities.

Central Area

Figure 8 graphs the benzene-time relationship for six wells in the central part of the site. Wells MW-M and MW-O are located adjacent to the MW-27 source area. The concentration in MW-M initially increased but it has stabilized since September 2005. The concentration in MW-O initially decreased before stabilizing the fourth quarter of 2004.

Well MW-Q is located farther down gradient from the MW-27 source area. The concentrations appear to be stable. The long-term concentrations in MW-MM, located down-gradient from the MW-26 source area, have also exhibited a decreasing trend that have stabilized from March 2009 to September 2009.

Wells MW-E and MW-I are on the down-gradient margin of the dissolved-phase plume. The concentration in MW-E remained below the NMWQCC groundwater standard. Benzene in MW-I has remained below this standard since June 2007. The above data confirm that the dissolved phase hydrocarbon plume is contracting along its margin.

Wells MW-9, MW-19, MW-28, MW-29, MW-30, MW-31, MW-F and MW-J are all located along the eastern, down-gradient edge of the Huston property. None of these boundary wells contained detectable concentrations of BTEX, again indicative that the plume is not expanding outside of its pre-study boundaries.

South Area

The benzene-time concentrations for the wells in the south area with concentrations above the method reporting limit are shown on Figure 9. Down-gradient boundary wells MW-16, MW-17 and MW-24 have never contained BTEX constituents above the method reporting limits so they are not included.

None of the wells in the south area exceed the NMWQCC groundwater BTEX standards (Figure 6). The benzene concentrations in MW-A continue to decline. The concentrations in MW-1 and MW-4 declined, and they appear to be varying at trace concentrations. The concentration in the irrigation well increased.

The concentrations in the remaining wells are all below the 0.002 method reporting limit. The House Well and MW-5 have not exceeded the method reporting limit since November 2007. The steady downward trend in all of the wells shown in Figure 9 demonstrates that the dissolved phase plume in this area is continuing to contract toward the north.

RECOMMENDATIONS

AEC recommends that the FPH removal continue as necessary in wells MW-26, MW-27, MW-N, MW-CC, MW-EE and MW-LL. Removal activities should cease one week prior to sampling to ensure accurate FPH thickness measurements.

The next monitoring episode is scheduled for the fourth quarter of 2009. Thank you for allowing AEC to complete this work. Do not hesitate to contact me if you have any questions or comments on this report.

Sincerely,

NOTES

1) Contour interval is 2 mg/l with a additional 0.01 mg/l boundary for the New Mexico Water Quality Control Commission Groundwater Standard
2) Wells containing free phase hydrocarbons are denoted as FPH and were not sampled
3) Duplicate values above the method reporting limit were averaged together

- [ ] VOC vials have headspace
- [ ] Sample labels missing or illegible
- [ ] ID on COC does not match label(s)
- [ ] D/T on COC does not match label(s)
- [ ] Sample/Bottles rcvd but no analysis on COC
- [ ] Sample listed on COC, but not received
- [ ] Bottles missing for requested analysis
- [ ] Insufficient volume for analysis
- [ ] Sample received improperly preserved

TRIP BLANK INFORMATION

- [ ] Trip Blank on COC but not received
- [ ] Trip Blank received but not on COC
- [ ] Trip Blank not intact
- [ ] Received Water Trip Blank
- [ ] Received Soil TB

Number of Encores?
Number of 5035 kits?
Number of lab-filtered metals?

Summary of Discrepancies:
1- #54 id - MS/MSD - Not Sure where to assign

TECHNICIAN SIGNATURE/DATE: Susan Huil

INFORMATION AND SAMPLE LABELING VERIFIED BY: 9 C 9 269

CORRECTIVE ACTIONS

Client Representative Notified: Michael Stewart **Date:** 9/28/09

By Accutest Representative: Georgia Jones Via: (Phone) Email

Client Instructions:
Sample MW-24 is the parent sample for the MS/MSD ~~K38~~

Matrix Spike/Matrix Spike Duplicate Summary

Job Number: T38388
Account: DUKE DCP Midstream, LLC
Project: AECCOLI: DCP Midstream Eldridge

Sample	File ID	DF	Analyzed	By	Prep Date	Prep Batch	Analytical Batch
T38346-1MS	Z0052767.D	1	10/04/09	JL	n/a	n/a	VZ2623
T38346-1MSD	Z0052768.D	1	10/04/09	JL	n/a	n/a	VZ2623
T38346-1	Z0052764.D	1	10/04/09	JL	n/a	n/a	VZ2623

The QC reported here applies to the following samples: Method: SW846 8260B

T38388-13

CAS No.	Compound	T38346-1 ug/l	Q	Spike ug/l	MS ug/l	MS %	MSD ug/l	MSD %	RPD	Limits Rec/RPD
