February 12, 2010
File No. 109637.1-ALB10RP001

Mr. Brad Jones
New Mexico Energy, Minerals, and Natural Resources Department
Oil Conservation Division
1220 St. Francis Drive
Santa Fe, NM 87505

Subject: Submittal of a Notice of Intent to Perform a Hydrostatic Test
Pipeline Number 3201 – West of City of Farmington
San Juan County, New Mexico

Dear Mr. Jones:

On behalf of the El Paso Natural Gas Company (EPNG), Kleinfelder West, Inc. (Kleinfelder) is pleased to submit this Notice of Intent (NOI) for a hydrostatic test of the 3201 Pipeline. The scope of this NOI is different from an earlier NOI submitted on January 28, 2010. While it involves the same pipeline number, it is located on the west side of Farmington, NM and is about 1/8th the size of the project conducted on the east side of Farmington. Like the other project, EPNG is intending to dispose of the used hydrostatic test water into a Class 1 injection well therefore; no surface discharge of hydrostatic test water is planned.

As required by the United States Department of Transportation Pipeline and Hazardous Materials Safety Administration regulations, EPNG is planning to conduct pipeline reconditioning work on its 20-inch 3201 pipeline immediately west of the city of Farmington, New Mexico in mid to late March 2010. EPNG will be hydrostatically testing approximately 1,083 feet of used and new pipe on this pipeline.

Kleinfelder has included the required information for the NOI as stated in the "Guidelines for Hydrostatic Test Dewatering" dated January 11, 2007. Attached to this NOI are the following:

- Background Information;
- Notice of Intent Plan;
- Figure 1, EPNG 3201 Pipeline Undergoing Hydrostatic Test;
- Figure 2, Temporary Frac-Tank Staging for Hydrostatic Test Water;
- Figure 3, Temporary Frac-Tank Storage Location;
- Appendix A, Material Safety Data Sheets for N-Spec 120 Cleaner;
- Appendix B, Certification of Siting Criteria;
- Appendix C, Copy of Email from the New Mexico Abandoned Mine Lands Program and figures showing no active mines in the vicinity;
- Appendix D, Federal Emergency Management Administration Flood Insurance Rate Map;
- Appendix E, List of Landowners within 1/3 mile of the Boundary of the Temporary Frac-tank Storage Area near Mile Post 6,

8300 Jefferson NE, Suite B, Albuquerque, NM 87113 p | 505.344.7373 f | 505.344.1711

- Appendix F, Map of Landowners within 1/3 mile of the Pipeline Easement; and
- Appendix G, Public Notice text in English and Spanish.

Checks in the amount of $700.00 to cover the $100 filing fee and the $600 permit fee are included herein and made out to the New Mexico Water Quality Control Commission. As deemed necessary by the NMOCD, EPNG is prepared to post a public notice regarding this event in accordance with Subsection A, and B, D and F of NMAC 20.6.2.3108 at the frac-tank staging areas (Figures 2 and 3), the Farmington, New Mexico Post Office, and published in the Farmington Daily Times newspaper.

Kleinfelder prepared this NOI in a manner consistent with the level of care and skill ordinarily exercised by other members of Kleinfelder's profession practicing in the same locality, under similar conditions and at the date the services are provided. The information provided in this document is based on our understanding of the information provided by EPNG. The work performed was based on project information provided by EPNG.

Should you have any questions, please feel free to contact David Janney or Jill Hernandez (Kleinfelder) at (505) 344-7373, or Richard Duarte (EPNG) at (505) 831-7763.

Respectfully submitted,
KLEINFELDER WEST, INC.

Jill Hernandez, E.I.T.
Staff Engineer

BACKGROUND INFORMATION

- The EPNG Pipeline number 3201 is an existing 20-inch (outside diameter) natural gas pipeline that has been in service since 1953.
- This transportation pipeline is part of a network that transports natural gas (sweet and dry) that is suitable for immediate consumer use.
- Based upon recent experience with the NMOCD, EPNG understands that the water used for cleaning and testing this pipeline system is generally classified as non-exempt RCRA waste and is subject to the Water Quality Control Commission (WQCC) Regulations.

NOTICE OF INTENT PLAN

On behalf of EPNG, Kleinfelder is submitting this NOI plan as outlined in NMOCD Guidance document, "Guidelines for Hydrostatic Test Dewatering," (revised January 11, 2007). The NOI plan includes the following items:

Item a. Name and address of the proposed discharger;

Legally Responsible Party	Sam A. Armenta, Director El Paso Natural Gas Company Albuquerque Division 8725 Alameda Park Dr. NE Albuquerque, NM 87120
Local Representative	Richard Duarte (505) 831-7763 El Paso Natural Gas Company 8725 Alameda Park Dr. NE Albuquerque, NM 87120
Operator	
Physical Address	El Paso Natural Gas Company San Juan Area Office #81 County Road 4900 Bloomfield, NM 87413
Mailing Address	El Paso Natural Gas Company San Juan Area Office P.O. 127 Bloomfield, NM 87413

Item b. Location of the discharge, including a street address, if available, and sufficient information to locate the facility with respect to surrounding landmarks;

The location of the portions of the 3201 pipeline to be hydrostatically tested is shown on Figure 1. The segment of 3201 pipeline that will be hydrostatically tested is immediately west of the City of Farmington, near the intersection of 30th Street and La Plata Highway (State Road 170). The western edge of pipeline segment starts at Mile Post ("MP") 6-43+78 and goes east under SR 170 and 30th Street to MP 7-01+81. It is approximately 1,083 feet in total length. One or two frac-tanks will be located 50 feet east of SR 170 and about 90 feet southeast of the intersection of SR 170 and 30th Street. EPNG is securing this additional land (north of its right

KLEINFELDER 8300 Jefferson NE, Suite B, Albuquerque, NM 87113 p | 505.344 7373 f | 505.344.1711

of way) from the land owner. Coordinates for this tank staging location are Latitude 36° 45' 27.06" North, Longitude 108° 14' 31.08" West.

Prior to the hydrostatic test, the pipeline will be cleaned to remove oil residue and other trace contaminants. There will be a small volume of water mixed with pipe cleaning liquid (N-Spec 120, see Appendix A for material safety data sheet). The segment cleaning will generate water (RCRA non-exempt), which is subject to regulation by the WQCC. The volume of cleaning solution is estimated to be 1,000 gallons. The source of water mixed with the pipe cleaning liquid will be public utility drinking water from the City of Farmington.

The pipe cleaning solution will be used to clean the entire 3201 pipeline, from mile post (MP) 0 to MP 22 and will be stored at EPNG's Blanco Compressor Station (GW-49-0, Figure 3). After cleaning the pipeline, the cleaning solution will be moved from the pipeline directly into a frac-tank (stored within secondary containment), then transferred into tank trucks for transportation to a recycling facility.

The temporary frac-tank storage location for the cleaning solution will be located at Mile post 0 + 0000', at the discharge side of Blanco Compressor Station (south side of the station), County Road 4900, #81, Bloomfield, NM 87413. This is locally known as "gasoline alley" road. Coordinates for this location are Latitude 36° 43' 44.55" North, Longitude 107° 57' 40.12" West. The temporary storage area is within the compressor station boundary. The frac-tank will be located within 50 feet of the point of connection on the 3201 pipeline. There will be one 21,000-gallon temporary tank with the water/N-SPEC mixture at this location and the liquid may be stored for up to two weeks. In the event that laboratory analysis or removal transportation is delayed, EPNG will request an additional two weeks of storage time. Every effort will be made to remove the liquid within two weeks. The 21,000-gallon tank is required to contain the high pressure discharge (above 850 pounds per square inch) and high flow rates utilized to drain the 3201 pipeline. The temporary frac-tank storage area at the Blanco Compressor Station is shown on Figure 3.

The permitted recycling facilities that will be used for the cleaning solution are:

Mesa Environmental, a Division of Mesa Oil, Inc.
Corporate - 17300 Hwy 72, Arvada, CO 80007
Regional Processing Facility – 20 Lucero Road, Belen, NM 87002

Or,

Thermo Fluids Inc.
Corporate – 8925 E. Pima Center Pkwy, Suite 105, Scottsdale, AZ 85258
Local Office – 9010 Bates Road, SW, Albuquerque, NM 87105

After the pipeline has been cleaned, public utility drinking water from the City of Farmington, NM will be used to perform hydrostatic testing of the segment of the 3201 pipeline. The segment is as follows: MP 6-43+78 to MP 7-01+81 in Section 6, Township 29 North, Range 13 West to MP 13-47+80 in Section 6, Township 29 North, Range 13 West (Figure 2). Approximately 10,000 gallons of water will be used for the hydrostatic test. The segment will be tested in two sections. The mid-point at MP 6-47+26 will be the staging area for two frac-tanks.

Upon completion of the hydrostatic test, EPNG will generate a second volume of water (RCRA non-exempt) that may be subject to regulation: the hydrostatic test water. The test water will be initially transferred into clean portable frac-tanks (stored within secondary containment), located

KLEINFELDER 8300 Jefferson NE, Suite B, Albuquerque, NM 87113 p | 505.344.7373 f | 505.344.1711

in the staging area at the midpoint of the segment (Figure 2). Due to an enhanced pipeline cleaning protocol, EPNG believes that the hydrostatic test water may meet the WQCC standards for ground water with contaminant concentrations not exceeding levels listed in Subsections A, B, and C of NMAC 20.6.2.3103.

Item c. Legal description of the discharge location;

Introduction, removal, and storage of hydrostatic test water will occur in the staging area at the following location:

SE/4 of the NE/4 of Section 6, Township 29 North, Range 13 West in San Juan County, New Mexico (See Figure 2).

Introduction, removal, and storage of cleaning solution will occur at the following location:

SE/4 of the NW/4 Section 14, Township 29 North, Range 11 West in San Juan County, New Mexico (See Figure 3).

Item d. Maps (site-specific and regional) indicating the location of the pipelines to be tested;

Figure 1 is a site-specific map showing topography, the pipeline sections undergoing testing, and the hydrostatic test water staging area. Figure 2 is a larger scaled, site-specific map showing the hydrostatic test water storage location. Figure 3 is a larger scaled, site-specific map showing the pipeline cleaning solution storage location.

Item e. A demonstration of compliance to the following siting criteria or justification for any exceptions:

- ***i. Within 200 feet of a watercourse, lakebed, sinkhole, or playa lake;***
- ***ii. Within 1,000 feet of an existing wellhead protection area or 100-year floodplain;***
- ***iii. Within, or within 500 feet of, a wetland;***
- ***iv. Within the area overlying a subsurface mine; or***
- ***v. Within 500 feet from the nearest permanent residence, school, hospital, institution or church.***

According to Mr. Arnold V. Madrid, EPNG's Technician, evidence of the above listed features was present within the required radius limits of the proposed hydrostatic test water staging area. Mr. Madrid performed a site visit to look for the presence of watercourses, lakebeds, sinkholes, playa lakes, wells, wetlands, residences, schools, hospitals, institutions, mines and churches. According to Mr. Madrid, the La Plata River's green-belt is located approximately 756 feet east of the temporary frac-tank staging area near MP 6. The La Plata River is located approximately 926 feet to the east. The nearest residence, an apartment complex, is located approximately 203 feet to the west of the temporary frac-tank staging area near MP 6. Mr. Madrid did not observe any: watercourses, lakebeds, sinkholes, playa lakes, wetlands, water wells, mines, schools, hospitals, or churches near this location. A Certification of Siting Criteria from Mr. Madrid is attached in Appendix B.

A search for surrounding water wells was completed to satisfy a portion of this requirement. The NMOCD Pit Rule Mapping Portal Database and the NMOSE Waters Database were used for this search, which was conducted on February 10, 2010. According to the search, one

KLEINFELDER 8300 Jefferson NE, Suite B, Albuquerque, NM 87113 p | 505.344.7373 f | 505.344.1711

domestic/stock well appears to be located within 1,000 feet of the proposed cleaning solution storage area. Well number SJ 01426 is located approximately 800 feet to the southwest. It is unknown if this well is active, inactive, or abandoned. Based on the database search, two water wells are located within 1,000 feet of the temporary frac-tank staging area (MP 6-47+26). Well numbers SJ 00993 and SJ 02025 are located approximately 266 and 492 feet from the temporary frac-tank staging area, respectively. Well number SJ 00993 was installed as a public works construction well in 1979 and is most likely not active. Well number SJ 02025 is a livestock watering well. It is not known if this well is active, inactive, or abandoned.

Mr. Andy Edmondson of the New Mexico Environment Department, Drinking Water Bureau was contacted to obtain information regarding wellhead protection areas located within 1,000 feet of the temporary staging areas for the water and cleaning solution. Mr. Edmondson has not provided confirmation concerning the locations of any wellhead protection areas, as of the time this report was prepared.

Mr. Mike Tompson with the New Mexico Abandoned Mine Lands Program (505-476-3427) was contacted to assess the presence of abandoned subsurface mines in the vicinity of the temporary frac-tank staging area. According to Mr. Tompson, there is no record of abandoned subsurface mines in that area. A copy of the email from Mr. Tompson is attached in Appendix C. According to the NM Tech "Pit Rule Mapping Portal" data base, there are no active or inactive mines in the vicinity of the temporary frac-tank staging areas. A figure generated from this portal is included in Appendix C.

Federal Emergency Management Administration (FEMA) flood insurance rate maps were generated from the FEMA website to search for 100-year floodplains in the proposed hydrostatic test water storage area. According to the FEMA website, the temporary frac-tank staging area is not located within a floodplain. A 100-year floodplain is located approximately 200 feet to the east. The FEMA flood insurance rate map for this area is attached under Appendix D.

Although a residence and a 100-year floodplain zone are located within 500 feet and 1,000 feet, respectively, of the temporary staging area, the hydrostatic test is not anticipated to adversely affect the surrounding populations. The pipeline will be cleaned prior to testing. Potable public utility water will used to conduct the hydrostatic testing. Secondary containment will be located surrounding the frac-tanks used for the temporary storage of the cleaning solution and test water, as described in subsequent items. In addition, hydrostatic testing analytical results from similar project conducted in November 2009 on the 1202 pipeline revealed that most constituents were below regulatory limits.

Item f. A brief description of the activities that produce the discharge;

Pressure testing with water, known as hydrostatic testing, is one of the tools pipeline operators use to verify pipeline integrity. The test involves purging the natural gas from the pipeline, cleaning the pipeline with an aqueous, non-hazardous cleaning fluid, filling the pipeline with water, then pressurizing the pipeline to a pressure higher than the standard operating pressure for approximately nine hours. The purpose of hydrostatic testing in a pipeline is to determine the extent to which potential defects might threaten the pipeline's ability to sustain maximum allowable operation pressure. If leaks or breaks occur, the pipeline is repaired or the affected areas is replaced, and then re-tested. The U.S. Department of Transportation Pipeline and Hazardous Materials Safety Administration (PHMSA) requires periodic pressurized tests on all DOT-regulated pipelines and all newly installed pipelines to verify the integrity and safety of pipeline systems. Approximately 10,000 gallons of public utility water from the City of Farmington will be used for the hydrostatic testing and pipeline cleaning.

KLEINFELDER 8300 Jefferson NE, Suite B, Albuquerque, NM 87113 p | 505.344.7373 f | 505.344.1711

Item g. The method and location for collection and retention of fluids and solids;

Cleaning Solution

Approximately 1,000 gallons of N-Spec 120 cleaning solution will be used to clean the pipeline. The cleaning solution will be moved from the 21,000-gallon frac-tank via hoses and/or flexible pipe and routed directly into the 3201 pipeline at the Blanco compressor station. The frac-tank will be located within 50 feet of the point of connection on the 3201 pipeline. The secondary containment around the frac-tank will consist of 80 mil plastic sheeting placed over a berm constructed of straw bales and secured with metal "T" posts. The location of the frac-tank and the pipeline discharge point are presented on Figure 3

After cleaning the pipeline, the entire volume of N-Spec 120 cleaning solution and water will be transferred back into the frac-tank. A pre-disposal composite sample will be collected and submitted to an EPA-approved analytical laboratory for waste characterization. The waste characterization will include analysis for corrosivity, ignitability, reactivity, toxicity, and/or other waste characterization as required by Mesa Environmental or Thermo-Fluids (see contact information under Item b).

Hydrostatic Test Water

Approximately 10,000 gallons of water will be used for hydrostatic testing of the 3201 pipeline. The hydrostatic test water will be removed from the pipeline via hoses and/or flexible pipe using drip pans under the connection points and stored in one or two frac-tanks with secondary containment at the hydrostatic test water staging area (Figure 2). The frac-tanks will be located within 50 feet of the point of connection on the 3201 pipeline. The secondary containment around the frac-tanks will consist of 80 mil plastic sheeting placed over a berm constructed of straw bales and secured with metal "T" posts. All individual tank valves will be closed and locked when not in use. Solids are not anticipated to be produced from the hydrostatic testing. EPNG also plans to have the frac-tank staging area under 24-hour security surveillance.

Item h. A brief description of best management practices to be implemented to contain the discharge onsite and to control erosion;

EPNG intends to discharge the hydrostatic test water in a Class I injection well. The water will be transported off the project site using DOT approved tanker trucks. No upland discharges are planned or intended.

Item i. A request for approval of an alternative treatment, use, and/or discharge location (other than the original discharge site), if necessary;

In the event that the hydrostatic test water is found to be unsuitable for down-hole injection, EPNG will acquire a temporary identification number from the US Environmental Protection Agency for the waste, and it will be properly transported and disposed of at a RCRA permitted Treatment, Storage, and Disposal facility. EPNG will provide the name and address of the facility and the appropriate disposal documentation to the NMOCD.

Item j. A proposed hydrostatic test wastewater sampling plan;

EPNG will not collect nor analyze a pre-test sample of the water obtained from the City of Farmington. Water quality analytical data supplied by the City of Farmington will be used as a baseline to determine if the water is suitable for use.

KLEINFELDER 8300 Jefferson NE, Suite B, Albuquerque, NM 87113 p | 505.344.7373 f | 505.344.1711

Prior to hydrostatic testing of the 3201 pipeline, approximately 10,000 gallons of public utility water will be transferred from the City of Farmington into frac-tanks located within EPNG's 3201 pipeline easement (See location information under Item c., and Figures 2 and 3).

After the hydrostatic testing of the 3201 pipeline, approximately 10,000 gallons of water will be transferred from the pipeline back into the same frac-tanks that were previously used to store the water. A single pre-disposal composite sample (one sample from each frac-tank) will be collected from the frac-tanks and submitted to an EPA-approved analytical laboratory.

The post-hydrostatic test water samples will be analyzed for corrosivity, ignitability, reactivity, toxicity, and/or other characterization as required by Key Energy. Analytical results of the post-hydrostatic test water analysis will be submitted to the NMOCD with a recommendation for disposal of the hydrostatic test water into a Class 1 injection well.

Item k. A proposed method of disposal of fluids and solids after test completion, including closure of any pits, in case the water generated from test exceeds the standards as set forth in Subsections A, B, and C of the 20.6.2.3103 NMAC (the New Mexico Water Quality Control Commission Regulations);

All fluids will be containerized, tested, and transported for disposal as described under item i and f. No solid waste is anticipated. In the event that the hydrostatic test water is found to be unsuitable for down-hole injection well disposal, a temporary identification number will be acquired from the US Environmental Protection Agency for the waste, and it will be properly transported and disposed of at a RCRA-permitted Treatment, Storage, and Disposal facility. EPNG will provide the name and address of the facility and the appropriate disposal documentation to the NMOCD.

Following the disposal characterization analysis, the 1,000 gallons of cleaning solution (used to clean the 3201 pipeline prior to hydrostatic testing) will be transported off-site via DOT-approved tanker trucks for treatment and disposal by Mesa Environmental or Thermo-Fluids (see contact information under Item b).

Item l. A brief description of the expected quality and volume of the discharge;

The hydrostatic test water will be analyzed to assess if the constituent concentrations meet Key Energy's disposal requirements for their Class 1 injection well. Based on historical data collected from previous hydrostatic test events using similar methods and solutions, the water quality is expected to be in compliance with regulatory limits. The volume of the hydrostatic test water is expected to be approximately 10,000 gallons.

Item m. Geological characteristics of the subsurface at the proposed discharge site;

Regional Features

The water storage location is within the north-central part of the San Juan Basin, a large asymmetric structural depression that contains Paleozoic and Mesozoic sediments up to 15,000 feet thick. The area is characterized by bedrock hillsides and mesas and Pleistocene gravel terraces of the La Plata River.

Site Geology

The water storage areas are located on alluvium overlying the Kirtland Shale and Fruitland Formations. The alluvium in the water storage area consists mainly of gravel and coarse sand over 8 feet in thickness, with some silt and clay. The alluvium was deposited by fluvial action.

KLEINFELDER 8300 Jefferson NE, Suite B, Albuquerque, NM 87113 p | 505.344 7373 f | 505.344.1711

The Kirtland Shale and Fruitland Formations consist of interbedded sandy shale, carbonaceous shale, clayey sandstone and sandstone (Stone, et. al., 1983).

Item n. The depth to and total dissolved solids concentration of the ground water most likely to be affected by the discharge;

Regional Hydrogeology

Three ground-water systems are present in the Tertiary and younger sedimentary deposits in this portion of the San Juan Basin.

- Confined aquifers in Tertiary sandstone units.
- Unconfined (water table) aquifers in Tertiary sandstone units near outcrop areas.
- Unconfined (water table) aquifers in the Quaternary alluvium in or near river valleys and tributaries.

Local Groundwater Hydrology

Two groundwater regimes exist near the discharge sites:

1. Unconfined aquifers in the alluvium beneath the water storage areas; and
2. Unconfined sandstone aquifers in the Cretaceous Kirtland Shale or Fruitland Formations below the alluvium (Stone, et. al., 1983).

Groundwater in the vicinity of the discharge location may be as shallow as six feet below ground surface in the alluvium (Stone, et. al., 1983).

Total dissolved solids concentrations of 12,000 milligrams per liter or greater have been observed in the groundwater (Geology Section, New Mexico State Highway Department, Materials and Testing Laboratory).

Item o. Identification of landowners at and adjacent to the discharge collection/retention site.

Landowners of the collection/retention sites:

At Blanco Plant (for the cleaning solution retention) and at MP 12-15+00 (hydrostatic test water staging area):

El Paso Natural Gas Company
2 North Nevada Ave.
Colorado Springs, CO 80903

Landowners along the EPNG right-of-way affected by the hydrostatic testing:

George E. Hutchison
R. D. Golding
Joe O. Campbell
George A. Greenwood
George A. McColm
D. & R. G. W. Railroad
B. E. Dustin
Elbie S. Evans
United States of America (Bureau of Land Management)

KLEINFELDER 8300 Jefferson NE, Suite B, Albuquerque, NM 87113 p | 505.344.7373 f | 505.344.1711

Landowners within 1/3-mile of the boundary of the temporary frac-tank storage area on EPNG property within the pipeline easement:

This landowners list is provided in Appendix E and a map showing the locations of these landowners is provided in Appendix F. EPNG it will provide all affected landowners with a brief description of the work involved.

As deemed necessary by NMOCD, a public notice will be posted in accordance with Subsections A, B, D and F of NMAC 20.6.2.3108 at the frac-tank staging areas (Figures 2 and 3), the Farmington, New Mexico Post Office, and published in the Farmington Daily Times newspaper. Copies of the English and Spanish versions of the public notices are presented in Appendix G. EPNG it will provide all affected landowners with a brief description of the work involved.

Material Safety Data Sheets for N-Spec 120 Cleaner

Material Safety Data Sheet

Section 1. Chemical Product and Company Identification

Common Name	**N-SPEC 120 Cleaner**
Supplier	Coastal Chemical Co., L.L.C. 3520 Veterans Memorial Drive Abbeville, LA 70510 337-893-3862
Synonym	Not available.
Trade name	Not available.
Material Uses	Not available.
Manufacturer	Coastal Chemical Co., L.L.C 3520 Veterans Memorial Drive Abbeville, LA 70510 337-893-3862

Code	
MSDS#	Not available.
Validation Date	**9/2/2004**
Print Date	9/2/2004
Responsible Name	**Charles Toups**

Section 2. Composition and Information on Ingredients

Name	CAS #	% by Weight	Exposure Limits
Confidential infomation			

Section 3. Hazards Identification

Physical State and Appearance Liquid.

Emergency Overview

CAUTION!
MAY CAUSE EYE IRRITATION.
MAY CAUSE SKIN IRRITATION.
MAY BE HARMFUL IF SWALLOWED.

Keep away from heat, sparks and flame. Avoid contact with eyes. Do not ingest. Avoid prolonged or repeated contact with skin. Keep container closed. Use only with adequate ventilation. Wash thoroughly after handling.

Routes of Entry Eye contact. Inhalation. Ingestion.

Potential Acute Health Effects

Eyes Hazardous in case of eye contact (irritant). Inflammation of the eye is characterized by redness, watering, and itching.

Skin Irritation of the product in case of skin contact: Not available.
Hazardous in case of skin contact

Inhalation Hazardous in case of inhalation.

Ingestion Hazardous in case of ingestion.

Potential Chronic Health Effects

CARCINOGENIC EFFECTS: Not available.
MUTAGENIC EFFECTS: Not available.
TERATOGENIC EFFECTS: Not available.

Medical Conditions Aggravated by Overexposure: Repeated or prolonged exposure is not known to aggravate medical condition.

Overexposure /Signs/Symptoms Not available.

See Toxicological Information (section 11)

Continued on Next Page

Section 4. First Aid Measures

Eye Contact	Check for and remove any contact lenses. Immediately flush eyes with running water for at least 15 minutes, keeping eyelids open. Cold water may be used. Get medical attention immediately.
Skin Contact	In case of contact, immediately flush skin with plenty of water for at least 15 minutes while removing contaminated clothing and shoes. Cold water may be used.Wash clothing before reuse. Thoroughly clean shoes before reuse. Get medical attention.
Inhalation	If inhaled, remove to fresh air. If not breathing, give artificial respiration. If breathing is difficult, give oxygen. Get medical attention.
Ingestion	Do NOT induce vomiting unless directed to do so by medical personnel. Never give anything by mouth to an unconscious person. If large quantities of this material are swallowed, call a physician immediately. Loosen tight clothing such as a collar, tie, belt or waistband.
Notes to Physician	Not available.

Section 5. Fire Fighting Measures

Flammability of the Product	Not available
Auto-ignition Temperature	Not available.
Flash Points	Tested - No Flash present
Flammable Limits	Not available.
Products of Combustion	These products are carbon oxides (CO, CO2), sulfur oxides (SO2, SO3...).
Fire Hazards in Presence of Various Substances	Not available.
Explosion Hazards in Presence of Various Substances	Risks of explosion of the product in presence of mechanical impact: Not available. Risks of explosion of the product in presence of static discharge: Not available.
Fire Fighting Media and Instructions	SMALL FIRE: Use DRY chemical powder. LARGE FIRE: Use alcohol foam, water spray or fog. Cool containing vessels with water jet in order to prevent pressure build-up, autoignition or explosion.
Protective Clothing (Fire)	Be sure to use an approved/certified respirator or equivalent.
Special Remarks on Fire Hazards	No additional remark.
Special Remarks on Explosion Hazards	Not available.

Section 6. Accidental Release Measures

Small Spill and Leak	The concentrated form of this material is a cleaner. During application, hazardous material on the apparatus or structure being cleaned may become part of the cleaning solution. Check with all applicable regulations before disposing of the material created during application.
Large Spill and Leak	The concentrated form of this material is a cleaner. During application, hazardous material on the apparatus or structure being cleaned may become part of the cleaning solution. Check with all applicable regulations before disposing of the material created during application.

Continued on Next Page

Section 7. Handling and Storage

Handling	Keep away from heat, sparks and flame. Keep container closed. Use only with adequate ventilation. To avoid fire or explosion, dissipate static electricity during transfer by grounding and bonding containers and equipment before transferring material. Use explosion-proof electrical (ventilating, lighting and material handling) equipment.
Storage	Keep container tightly closed and in a well-ventilated place.

Section 8. Exposure Controls/Personal Protection

Engineering Controls	Provide exhaust ventilation or other engineering controls to keep the airborne concentrations of vapors below their respective threshold limit value. Ensure that eyewash stations and safety showers are proximal to the work-station location.
Personal Protection	
Eyes	Safety glasses.
Body	Lab coat.
Respiratory	Wear appropriate respirator when ventilation is inadequate.
Hands	Impervious gloves.
Feet	Not applicable.
Personal Protection in Case of a Large Spill	Splash goggles. Full suit. Boots. Gloves. Suggested protective clothing might not be sufficient; consult a specialist BEFORE handling this product.

Product Name	Exposure Limits
Confidential infomation	

Consult local authorities for acceptable exposure limits.

Section 9. Physical and Chemical Properties

Physical State and Appearance	Liquid.
Molecular Weight	Not applicable.
Molecular Formula	Not applicable.
pH (1% Soln/Water)	6 to 8 [Neutral.]
Boiling/Condensation Point	The lowest known value is 100°C (212°F) (Water). Weighted average: 140.43°C (284.8°F)
Melting/Freezing Point	May start to solidify at 0°C (32°F) based on data for: Water. Weighted average: -46.19°C (-51.1°F)
Critical Temperature	Not available.
Specific Gravity	0.9 to 0.98 (Water = 1)
Vapor Pressure	The highest known value is 2.3 kPa (17.2 mm Hg) (at 20°C) (Water). Weighted average: 1.17 kPa (8.78 mm Hg) (at 20°C)
Vapor Density	The highest known value is 5.11 (Air = 1). Weighted average: 2.93 (Air = 1)
Volatility	Not available.
Odor Threshold	The highest known value is 34.6 ppm
Evaporation Rate	0.02 compared to Butyl acetate
VOC	Not available.

Odor	Not available.
Taste	Not available.
Color	Blue. (Dark.)

Continued on Next Page

Viscosity	Not available.
$LogK_{ow}$	The product is much more soluble in water.
Ionicity (in Water)	Anionic.
Dispersion Properties	See solubility in water, methanol, diethyl ether.
Solubility	Easily soluble in cold water, hot water, methanol, diethyl ether. Insoluble in n-octanol.
Physical Chemical Comments	Not available.

Section 10. Stability and Reactivity

Stability and Reactivity	The product is stable.
Conditions of Instability	Not available.
Incompatibility with Various Substances	Reactive with oxidizing agents, acids. Slightly reactive to reactive with reducing agents.
Hazardous Decomposition Products	Not available.
Hazardous Polymerization	Will not occur.

Section 11. Toxicological Information

Toxicity to Animals	Acute oral toxicity (LD50): 1900 mg/kg [Rat]. Acute dermal toxicity (LD50): 9510 mg/kg [Rabbit].
Chronic Effects on Humans	No additional remark.
Other Toxic Effects on Humans	Hazardous in case of eye contact (irritant), of ingestion, of inhalation. Hazardous in case of skin contact (irritant). Slightly hazardous in case of skin contact (sensitizer).
Special Remarks on Toxicity to Animals	Not available.
Special Remarks on Chronic Effects on Humans	Not available.
Special Remarks on Other Toxic Effects on Humans	Material is irritating to mucous membranes and upper respiratory tract.

Section 12. Ecological Information

Ecotoxicity	Not available.
BOD5 and COD	Not available.
Biodegradable/OECD	Not available.
Mobility	Not available.
	These products are carbon oxides (CO, CO_2) and water, nitrogen oxides (NO, NO_2...), sulfur oxides (SO_2, SO_3...), phosphates. Some metallic oxides.
Toxicity of the Products of Biodegradation	The products of degradation are less toxic than the product itself.

Continued on Next Page

Special Remarks on the Products of Biodegradation	Not available.

Section 13. Disposal Considerations

Waste Information	Waste must be disposed of in accordance with federal, state and local environmental control regulations.
Waste Stream	Not available.

Consult your local or regional authorities.

Section 14. Transport Information

Shipping Description	Not a DOT controlled material (United States).
	Not regulated.
Reportable Quantity	11061.8 lbs. (5016.7 kg)
Marine Pollutant	Not regulated - Alkylaryl sulfonate amine salt - less then 10 % .
Special Provisions for Transport	Contains alkylbenzenesulfonate

Section 15. Regulatory Information

HCS Classification	CLASS: Target organ effects.
U.S. Federal Regulations	TSCA 8(a) PAIR: contains Alkylbenzenesulfonate SARA 302/304/311/312 extremely hazardous substances: No products were found. SARA 302/304 emergency planning and notification: No products were found. SARA 302/304/311/312 hazardous chemicals: No products were found. SARA 311/312 MSDS distribution - chemical inventory - hazard identification: No products were found. SARA 313 toxic chemical notification and release reporting: No products were found. Clean Water Act (CWA) 307: No products were found. Clean Water Act (CWA) 311: No products were found. Clean air act (CAA) 112 accidental release prevention: No products were found. Clean air act (CAA) 112 regulated flammable substances: No products were found. Clean air act (CAA) 112 regulated toxic substances: No products were found.
International Regulations	
EINECS	Not available.
DSCL (EEC)	Risk to eyes. May cause irriationby skin contact. R322- May be harmful if swallowed. R36/38- Irritating to eyes and skin.
International Lists	No products were found.
State Regulations	Pennsylvania RTK: Dipropylene glycol monomethyl ether; Trade Secret; Gylcol Ether PNB Florida: Dipropylene glycol monomethyl ether; Ethanol Minnesota: Dipropylene glycol monomethyl ether Massachusetts RTK: Dipropylene glycol monomethyl ether; Ethanol New Jersey: Ethanol; Gylcol Ether PNB **WARNING:** This product contains the following ingredients for which the State of California has found to cause birth defects which would require a warning under the statute: Ethanol

APPENDIX B
Certification of Siting Criteria

1 Certification of Siting Criteria

Hydrostatic Testing of Line 3201 West of Farmington

On February 10, I, Arnold V. Madrid, performed review to look for the presence of the items listed below. Some were observed within the specified distance for each item listed below from the edge of the pipeline right of way to site where the one water storage tank will be located at mile post 6 + 4726 on Line 3201 in San Juan County, NM. The hydro-test water will also be introduced to the pipeline at this site. A note beside each item below describes my review.

i. Within 200 feet of a watercourse, lakebed, sinkhole, or playa lake; *NOTE: The actual La Plata River is further than this distance at 926 feet.*

ii. Within 1,000 feet of an existing wellhead protection area or 100-year floodplain; *NOTE : I will defer to the statement and research from our consultant, Kleinfelder. This information is included as part of the NOI.*

iii. Within, or within 500 feet of, a wetland; *NOTE: No, the La Plata River's green belt (the bosque) is a distance of 756 feet.*

iv. Within the area overlying a subsurface mine; *NOTE: I will defer to the statement and research from our consultant, Kleinfelder. This information is included as part of the NOI.*

v. Within 500 feet from the nearest permanent residence, school, hospital, institution or church. *NOTE: Yes. The nearest home (apartment complex immediately Westside of SR 170) is 203 feet from where the tank is planned to be staged.*

On behalf of El Paso Natural Gas, I state that the above information is complete and true to the best of my knowledge.

Jill Hernandez - RE: Abandoned Mines in Farmington, NM

From: "Tompson, Mike, EMNRD" <Mike.Tompson@state.nm.us>
To: "Jill Hernandez" <JHernandez@kleinfelder.com>
Date: 2/10/2010 8:27 AM
Subject: RE: Abandoned Mines in Farmington, NM

Jill,

We have no record of abandoned mines in those four sections. But again, not every abandoned mine is known to us so there could always be a chance of finding one in that area.

Hope that helps.

Mike Tompson

From: Jill Hernandez [mailto:JHernandez@kleinfelder.com]
Sent: Tuesday, February 09, 2010 3:29 PM
To: Tompson, Mike, EMNRD
Subject: Abandoned Mines in Farmington, NM

Mike,
I am preparing a notice of intent to complete a hydrostatic test in the Farmington area. Could you please let me know if there are any known, abandoned mines in the following areas:

- Section 6, Township 29N, Range 13W
- Section 5, Township 29N, Range 13W
- Section 32, Township 30N, Range 13W
- Section 31, Township 30N, Range 13W

Thanks, Jill

APPENDIX G
Public Notice Text in Spanish and English

PUBLIC NOTICE

The United States Department of Transportation (USDOT) requires periodic pressurized tests on all USDOT-regulated pipelines. El Paso Natural Gas Company (EPNG) hereby gives notice that the following discharge permit application has been submitted to the NM Oil Conservation Division (NMOCD) in accordance with Subsection A, B, D and F of 20.6.2.3108 of New Mexico Administrative Code (NMAC). The local EPNG mailing address is: El Paso Natural Gas, San Juan Area Office, P.O. Box 127, Bloomfield, NM 87413.

EPNG has submitted an application to perform a hydrostatic test of the 3201 Pipeline on the EPNG pipeline easement in Section 6, Township 29 North, Range 13 West in San Juan County, New Mexico. The purpose of hydrostatic (testing with water) is to determine the extent to which potential defects might threaten the pipeline's ability to sustain maximum allowable operation pressure. The test involves purging the natural gas from the pipeline, cleaning the pipeline with an aqueous, non-hazardous cleaning fluid, filling the pipeline with water, then pressurizing the pipeline to a pressure higher than the standard operating pressure for a specified duration of time.

A portion of the pipeline will be hydrostatically tested. Prior to hydrostatic testing, the pipeline will be cleansed using approximately [illegible] of an aqueous and non-hazardous cleaning fluid, N-Spec 120. The cleaning solution will be stored in one or two 21,000-gallon frac-tanks at EPNG's Blanco compressor station located in the SE/4 of the NW/4, Section 14, Township 29 North, Range 11 West. A composite sample of the cleaning solution will be analyzed for corrosivity, ignitability, reactivity, and toxicity for disposal characterization, as required by Mesa Environmental or Thermo Fluids, Inc. The water/cleaning solution mixture may be stored in frac-tanks for two weeks with the option to store it for an additional two weeks. This water will be transported for proper disposal to the Mesa Environmental regional processing facility in Belen, NM or Thermo Fluids, Inc. in Albuquerque, NM.

Up to 10,000 gallons of fresh, unused water, from the City of Farmington, will be initially stored in one or two 21,000-gallon frac-tanks located in the SE/4 of the NE/4 of Section 6, Township 29 North, Range 13 West, approximately 50 feet east of State Road 170 and 90 feet southeast of the intersection of State Road 170 and 30th Street, within the City of Farmington. Following hydrostatic testing, hoses and/or flexible pipes will be used to transfer the used test water into the frac-tanks. A composite sample of this water will be analyzed by an EPA-approved analytical laboratory for waste characterization analysis of corrosivity, ignitability, reactivity, toxicity, and/or other characterization as required by Key Energy. Used test water may be stored in the frac-tanks for two weeks with the option to store it for an additional two weeks. The hydrostatic test water will not be discharged. After receipt of NMOCD approval, it will be properly transported and injected into a permitted Class 1 injection well operated by Key Energy of Farmington, NM.

The shallowest groundwater likely to be affected by a leak, accidental discharge, or spill exists at a depth of approximately six feet below the ground surface. This aquifer system has a total dissolved solids concentration of approximately 12,000 milligrams per liter or greater.

The notice of intent outlines how produced water and [illegible] managed, including handling, storage, and final disposition. The plan also includes procedures for the [illegible] leaks, accidental discharges, and spills to the waters of the State of New Mexico.

For additional information, to be placed on a facility-specific mailing list for future notices, or to submit comments please contact:

The NM Energy, Minerals and Natural Resources Department will accept comments and statements of interest regarding this hydrostatic test and will provide future notices for this pipeline upon request.

AVISO PÚBLICO

El Ministerio de Transporte de los Estados Unidos (USDOT) requiere pruebas periódicas de presión en todas las tuberías reguladas por el USDOT. Por medio de la presente, la compañía El Paso Natural Gas (EPNG) da por notificado que el permiso de la siguiente descarga ha sido sometido a la división de la conservación de Aceite (Petroleo) de Nuevo México (NMOCD) de acuerdo con la subdivisión A, B, D, y F del código administrativo # 20.6.2.3108 de Nuevo México. La dirección local de correo de EPNG es: El Paso Natural Gas, San Juan Area Office, P.O. Box 127, Bloomfield, NM 87413.

El Paso Natural Gas ha introducido una solicitud para conducir una prueba hidrostática en la tubería 3201 ubicada en la servidumbre (o área de servicio) de EPNG localizada en la sección seis (6) del Township 29 Norte con el Range 13 Oeste en el condado de San Juan, Nuevo México. El propósito de la prueba hidrostática (utilizando agua) es determinar el grado de los posibles defectos que pudiesen amenazar (disminuir) la capacidad de la tubería de mantener la presión máxima de operación permitida. La prueba hidrostática implica la purga del gas natural de la tubería, limpieza de la tubería con un liquido de limpieza acuoso y no-peligroso, llenado de la tubería con agua, y finalmente la presurización de la tubería a una presión más alta que la presión estándar de funcionamiento por un determinado tiempo.

Una porción de la tubería 3201 de EPNG será probada hidrostáticamente. Antes de la prueba hidrostática, la tubería será limpiada usando aproximadamente 1.000 galones de un liquido de limpieza (N-Spec 120) acuoso y no-peligroso. El líquido de limpieza será almacenado en uno o dos tanques de 21.000 galones de capacidad en la estaciones de compresión Blanco de EPNG ubicada en el SE/4 del NW/4, sección 14, Township 29 Norte, Range 11 Oeste. Una muestra compuesta de la solución empleada para la limpieza será analizada para determinar la corrosividad, capacidad de ignición, reactividad y toxicidad para efectos de ser caracterizado como material de desecho, según lo requerido/estipulado por Mesa Ambiental o Thermo Fluids, Inc. La mezcla de agua/liquido de limpieza puede ser almacenada en los tanques (frac-tanks) por dos semanas, con una opción de ser almacenados por dos semanas adicionales.. Esta agua será transportada para la disposición apropiada en las instalaciones de procesamiento regional de Mesa Environmental en Belen, Nuevo México o Thermo Fluids, Inc. en Albuquerque, Nuevo México.

Hasta 10.000 galones de agua, sin utilizar, de la ciudad de Farmington, serán almacenados inicialmente en uno o dos tanques de 21.000 galones (frac-tanks) situados en el SE/4 del NE/4 del sección 6, Township 29 Norte, Range 13 Oeste, aproximadamente 50 pies al este de la Calle Estatal 170 y 90 pies sureste de la intersección de la Calle Estatal 170 y la Calle 30 en la ciudad de Farmington. Después de la prueba hidrostática, mangueras y/o las tuberías flexibles serán utilizadas para transferir el agua utilizada durante la prueba a los tanques (frac-tanks). Una muestra de esta agua será analizada por un laboratorio (de pruebas analíticas) aprobado por la Agencia de Protección Ambiental (EPA) para realizar un análisis de disposición de desechos por corrosividad, capacidad de ignición, reactividad, toxicidad y cualquier otro tipo de caracterización requerido por Key Energy. La mezcla agua/liquido de limpieza utilizada durante la prueba se puede almacenar en los tanques (frac-tanks) por dos semanas con una opción de ser almacenados por dos semanas adicionales. El agua hidrostática utilizada durante la prueba no será descargada al ambiente. Después de haber recibido la aprobación por parte de NMOCD, el agua utilizada será transportada e inyectada en un pozo de inyección permisado con la Clase 1 y operado por Key Energy en Farmington, Nuevo México.

El agua subterránea superficial probablemente será afectada por una fuga (goteo), una descarga accidental, o un derrame que exista a una profundidad aproximada de 6 pies por debajo de la superficie de tierra. El sistema del acuífero tiene una concentración total de sólidos en suspensión entre aproximadamente 12.000 miligramos por litro o mas.

La notificación de cómo se va a proceder, ejecutar y/o manejar el agua y la basura producida serán dirigidas correctamente, incluyendo su manejo, almacenaje, y disposición final de las mismas. El plan también incluye los procedimientos para el manejo apropiado de fugas, descargas accidentales, y de derrames en las aguas del Estado de Nuevo México.

Para información adicional, para ser colocado en la lista de personas a quienes se les envía propagandas específicas relacionadas con instalaciones/facilidades, o enviar para comentarios, favor contactar a:

Brad Jones, ingeniero ambiental
New Mexico Energy, Minerals and Natural Resources Department
Oil Conservation Division
1220 South St. Francis Drive
Santa Fe, NM 87505
Teléfono: (505) 476-3487

El Departamento de Energía, Recursos Naturales y Minerales aceptará comentarios y declaraciones de interés correspondientes a esta prueba hidrostática y proporcionará futuras notificaciones bajo petición.

Santa Fe, NM 87505

Subject: Submittal of a Notice of Intent to Perform a Hydrostatic Test
Pipeline Number 3201
San Juan County, New Mexico

Dear Mr. Jones:

On behalf of the El Paso Natural Gas Company (EPNG), Kleinfelder West, Inc. (Kleinfelder) is pleased to submit this Notice of Intent (NOI) for a hydrostatic test of the 3201 Pipeline. EPNG is intending to dispose of the used hydrostatic test water into a Class 1 injection well therefore; no surface discharge of hydrostatic test water is planned.

As required by US DOT Pipeline and Hazardous Materials Safety Administration regulations, EPNG is planning to conduct pipeline reconditioning work on its 20-inch 3201 pipeline near Farmington, New Mexico in mid to late February 2010. EPNG will be hydrostatically testing approximately 8,560 feet of used and new pipe on this pipeline.

Kleinfelder has included the required information for the NOI as stated in the "Guidelines for Hydrostatic Test Dewatering" dated January 11, 2007. Attached to this NOI are the following:

- Background Information;
- Notice of Intent;
- Figure 1, EPNG 3201 Pipeline Undergoing Hydrostatic Test;
- Figure 2, Temporary Frac-Tank Staging Location, Hydrostatic Test Water;
- Figure 3, Temporary Frac-Tank Staging Location, Cleaning Solution;
- Appendix A, Material Safety Data Sheets for N-Spec 120 Cleaner;
- Appendix B, Certification of Siting Criteria;
- Appendix C, Copy of Email from the New Mexico Abandoned Mine Lands Program;
- Appendix D, Federal Emergency Management Administration Flood Insurance Rate Maps;
- Appendix E, List of Landowners within 1/3 mile of the Pipeline Segments undergoing hydrostatic testing;
- Appendix F, Map of Landowners within 1/3 mile of the Pipeline Easement; and
- Appendix G, Public Notice text in Spanish and English

A check in the amount of $100.00 to cover the filing fee is included with this filing. As deemed necessary by the NMOCD, public notice will be posted in accordance with Subsection A, and B,

8300 Jefferson NE, Suite B, Albuquerque, NM 87113 p | 505.344.7373 f | 505.344.1711

D and F of NMAC 20.6.2.3108 at the frac-tank staging areas (Figures 2 and 3), the Farmington, New Mexico Post Office, and published in the Farmington Daily Times newspaper.

Kleinfelder prepared this NOI in a manner consistent with the level of care and skill ordinarily exercised by other members of Kleinfelder's profession practicing in the same locality, under similar conditions and at the date the services are provided. The information provided in this document is based on our understanding of the information provided by EPNG. The work performed was based on project information provided by EPNG.

Should you have any questions, please feel free to contact David Janney or Marco Wikstrom (Kleinfelder) at (505) 344-7373, or Richard Duarte (EPNG) at (505) 831-7763.

Respectfully submitted,
KLEINFELDER WEST, INC.

KLEINFELDER 8300 Jefferson NE, Suite B, Albuquerque, NM 87113 p | 505.344.7373 f | 505.344.1711

Background Information

- The EPNG Pipeline number 3201 is an existing 20-inch (outside diameter) natural gas pipeline that has been in service since 1953.
- This transportation pipeline is part of a network that transports natural gas (sweet and dry) that is suitable for immediate consumer use.
- Based upon recent experience with the NMOCD, EPNG understands that the water used for cleaning and testing this pipeline system is generally classified as non-exempt RCRA waste and is subject to the Water Quality Control Commission (WQCC) Regulations.

Notice of Intent Plan

On behalf of EPNG, Kleinfelder is submitting this NOI plan as outlined in NMOCD Guidance document, "Guidelines for Hydrostatic Test Dewatering," (revised January 11, 2007). The NOI plan includes the following items:

Item a. Name and address of the proposed discharger;

Legally Responsible Party	Sam A. Armenta, Director El Paso Natural Gas Company Albuquerque Division 8725 Alameda Park Dr. NE Albuquerque, NM 87120
Local Representative	Richard Duarte (505) 831-7763 El Paso Natural Gas Company 8725 Alameda Park Dr. NE Albuquerque, NM 87120
Operator	
Physical Address	El Paso Natural Gas Company San Juan Area Office #81 County Road 4900 Bloomfield, NM 87413
Mailing Address	El Paso Natural Gas Company San Juan Area Office P.O. 127 Bloomfield, NM 87413

Item b. Location of the discharge, including a street address, if available, and sufficient information to locate the facility with respect to surrounding landmarks;

The location of the portions of the 3201 pipeline to be hydrostatically tested is shown on figure 1. The segment of 3201 pipeline that will be hydrostatically tested is immediately west of the Animas River and within the City of Farmington and goes east of County Road 3000 by approximately 1-1/4 –mile. Approximately 7 frac-tanks will be located 700 feet southwest of the intersection of Gila Street and English Road within EPNG owned property along the 3201 Pipeline. Coordinates for this location are Latitude 36° 45' 25.64" North, Longitude 108° 08' 58.29" West.

KLEINFELDER 8300 Jefferson NE, Suite B, Albuquerque, NM 87113 p | 505.344.7373 f | 505.344.1711

Prior to the hydrostatic test, the pipeline will be cleaned to remove oil residue and other trace contaminants. The segment will generate water (RCRA non-exempt) subject to regulation by the WQCC. There will be a small volume of water mixed with pipe cleaning liquid (N-Spec 120, see Appendix A for material safety data sheet). The volume of cleaning solution is estimated to be 1,000 gallons. The source of water mixed with the pipe cleaning liquid will be public utility drinking water from the City of Farmington.

The pipe cleaning solution will be used to clean the entire 3201 pipeline, mile post (MP) 0 to MP 22 and will be stored at EPNG's Blanco Compressor Station (GW-49-0, Figure 3). After cleaning the pipeline, the cleaning solution will be moved from the pipeline directly into a frac-tank (stored within secondary containment), then transferred into tank trucks for transportation to a recycling facility.

The temporary frac-tank storage location for the cleaning solution will be:

Mile post 0 + 0000' is located at the discharge side of Blanco Compressor Station (south side of the station), County Road 4900, #81, Bloomfield, NM 87413. This is locally known as "gasoline alley" road. Coordinates for this location are Latitude 36° 43' 44.55" North, Longitude 107° 57' 40.12" West. The temporary storage area is within the compressor station boundary. The frac-tank will be located within 50 feet of the point of connection on the 3201 pipeline. There will be one 21,000-gallon temporary tank with the water/N-SPEC mixture at this location and the liquid may be stored for up to two weeks. In the event that laboratory analysis or removal transportation is delayed, EPNG will request an additional two weeks of storage time. Every effort will be made to remove the liquid within two weeks. A 21,000-gallon tank is required to contain the high pressure discharge (above 850 pounds per square inch) and high flow rates utilized to drain the 3201 pipeline. The temporary frac-tank storage area at Blanco is shown on Figure 3.

The permitted recycling facilities that will be used for the cleaning solution are:

Mesa Environmental, a Division of Mesa Oil, Inc.
Corporate - 17300 Hwy 72, Arvada, CO 80007
Regional Processing Facility – 20 Lucero Road, Belen, NM 87002

Or,

Thermo Fluids Inc.
Corporate – 8925 E. Pima Center Pkwy, Suite 105, Scottsdale, AZ 85258
Local Office – 9010 Bates Road, SW, Albuquerque, NM 87105

After the pipeline has been cleaned, public utility drinking water from the City of Farmington, NM will be used to perform hydrostatic testing of the segment of the 3201 pipeline. The segment is as follows; from MP 12 + 1500 in Section 6, Township 29N, Range 12W, to MP 13 +4780 in Section 7, Township 29N, Range 12W (Figure 2). Approximately 140,500 gallons of water will be used for the hydrostatic test.

Upon completion of the hydrostatic test, EPNG will generate a second volume of water (RCRA non exempt) that may be subject to regulation: the hydrostatic test water. The test water will be initially transferred into clean portable frac-tanks (stored within secondary containment) and held at one location (Figure 2). Due to an enhanced pipeline cleaning protocol EPNG believes that the hydrostatic test water may meet the WQCC standards for ground water with contaminant concentrations not exceeding levels listed in Subsections A, B, and C of NMAC 20.6.2.3103.

KLEINFELDER 8300 Jefferson NE, Suite B, Albuquerque, NM 87113 p | 505.344.7373 f | 505.344.1711

Item c. Legal description of the discharge location;

Introduction, removal, and storage of hydrostatic test water will occur in the staging area at the following location:

> SE/4 of the NE/4 of Section 1, Township 29 North, Range 13 West, in San Juan County, New Mexico (See Figure 2).

Introduction, removal, and storage of cleaning solution will occur at the following location:

> N/2 of the N/2 Section 14, Township 29 North, Range 11 West in San Juan County, New Mexico (See Figure 3).

Item d. Maps (site-specific and regional) indicating the location of the pipelines to be tested;

Figure 1 is a site-specific map showing topography, the pipeline sections undergoing test, and the hydrostatic test water staging area. Figure 2 is a larger scale site-specific map showing the hydrostatic test water storage location. Figure 3 is a larger scale site-specific map showing the pipeline cleaning solution storage location.

Item e. A demonstration of compliance to the following siting criteria or justification for any exceptions:

- ***i. Within 200 feet of a watercourse, lakebed, sinkhole, or playa lake;***
- ***ii. Within 1,000 feet of an existing wellhead protection area or 100-year floodplain;***
- ***iii. Within, or within 500 feet of, a wetland;***
- ***iv. Within the area overlying a subsurface mine; or***
- ***v. Within 500 feet from the nearest permanent residence, school, hospital, institution or church.***

According to Mr. Nestor Vigil, EPNG's Cross-Functional Technician, evidence of the above listed features is present within the required radius limits of the proposed staging area of hydrostatic test water. Mr. Vigil performed a site visit to look for the presence of watercourses, lakebeds, sinkholes, playa lakes, wells, wetlands, residences, schools, hospitals, institutions, mines and churches. According to Mr. Vigil, the Animas River green-belt is located approximately 435 feet southeast of the temporary frac-tank staging area near MP 12 and the nearest residence to this location approximately 90 feet. Mr. Vigil did not observe any of the items under "i." above, water wells, mines, schools, hospitals or churches near this location. A Certification of Siting Criteria from Mr. Vigil is attached in Appendix B.

A search for surrounding water wells was completed to satisfy a portion of this requirement. The New Mexico Water Rights Reporting System (NMWRRS, [iWaters]) database at the New Mexico Office of the State Engineer was used for this search, which was conducted on December 30, 2009. According to the search, a single water well may be located within 1,000 feet of the proposed cleaning solution storage area and another well is located approximately 1,000 feet east of the temporary frac-tank staging area near MP 12. These well, points of diversion numbers are 1426, located in the SE/4, NW4, Section 14, Township 29N, Range 11W and SJ01894, located in the SW/4, NW4, Section 6, Township 29N, Range 12W, respectively. It

KLEINFELDER 8300 Jefferson NE, Suite B, Albuquerque, NM 87113 p | 505.344.7373 f | 505.344.1711

is unknown if this well is active, inactive, or abandoned. No water storage area will be located within 1,000 feet of a well head protection area.

Mr. Mike Tompson with the New Mexico Abandoned Mine Lands Program (505-476-3427) was contacted to assess the presence of abandoned subsurface mines in the vicinity of the temporary frac-tank staging areas. According to Mr. Tompson, there is no record of abandoned subsurface mines in these areas. A copy of an email from Mr. Tompson is attached in Appendix C. According to "New Mexico Mines, Mills and Quarrys" data base maintained by the the New Mexico Energy Minerals and Natural Resources Department, there are no active mines in the vicinity of the temporary frac-tank staging areas. According to the NMOCD "Pit Rule mapping Portal" data base, there are no active or inactive mines in the vicinity of the temporary frac-tank staging areas.

Federal Emergency Management Administration (FEMA) flood insurance rate maps were generated from the FEMA website to search for 100-year floodplains in the proposed hydrostatic test water storage area. According to the FEMA website, the temporary frac-tank storage location is not within a floodplain. The FEMA flood insurance rate map for this area is attached under Appendix D.

Item f. A brief description of the activities that produce the discharge;

Pressure testing with water, known as hydrostatic testing, is one of the tools pipeline operators use to verify pipeline integrity. The test involves purging the natural gas from the pipeline, cleaning the pipeline with an aqueous, non-hazardous cleaning fluid, filling the pipeline with water, then pressurizing the pipeline to a pressure higher than the standard operating pressure for approximately nine hours. The purpose of hydrostatic testing in a pipeline is to determine the extent to which potential defects might threaten the pipeline's ability to sustain maximum allowable operation pressure. If leaks or breaks occur, the pipeline is repaired or the affected areas is replaced and then re-tested. The U.S. Department of Transportation Pipeline and Hazardous Materials Safety Administration (PHMSA) requires periodic pressurized tests on all DOT-regulated pipelines and all newly installed pipelines to verify the integrity and safety of pipeline systems. Approximately 140,500 gallons of public utility water from the City of Farmington will be used for the hydrostatic test and pipeline cleaning.

Item g. The method and location for collection and retention of fluids and solids;

The approximately 1,000 gallons of N-Spec 120 cleaning solution used to clean the pipeline will be moved from the 21,000-gallon frac-tank via hoses and/or flexible pipe and routed directly to the pipeline at the Blanco compressor station. The frac-tank will be located within 50 feet of the point of connection on the 3201 pipeline. The secondary containment around the frac-tank will consist of 80 mil plastic sheeting placed over a berm constructed of straw bales and secured with metal "T" posts. The location of the frac-tank and the pipeline discharge point are presented in (Figure 3).

After cleaning the pipeline, the entire volume of N-Spec 120 cleaning solution and water will be transferred back into the frac-tank and a pre-disposal composite sample will be collected and submitted to an EPA-approved analytical laboratory for waste characterization, including analysis for corrosivity, ignitability, reactivity, and toxicity, and/or other characterization as required by Mesa Environmental or Thermo-Fluids (see contact information under Item b.).

The approximately 140,500 gallons of water used for hydrostatic testing of the 3201 pipeline will be removed from the pipeline via hoses and/or flexible pipe using drip pans under the connection points and stored in 7 frac-tanks with secondary containment at the hydrostatic test water storage area (Figure 2). The frac-tanks will be located within 60 feet of the point of

KLEINFELDER 8300 Jefferson NE, Suite B, Albuquerque, NM 87113 p | 505.344.7373 f | 505.344.1711

connection on the 3201 pipeline. The secondary containment around the frac-tanks will consist of 80 mil plastic sheeting placed over a berm constructed of straw bales and secured with metal "T" posts. When not in use, all individual tank valves will be closed and locked. Solids are not anticipated to be produced from the hydrostatic testing. EPNG also plans to have the frac-tank staging area under 24-hour security surveillance.

Item h. A brief description of best management practices to be implemented to contain the discharge onsite and to control erosion;

EPNG intends to discharge the hydrostatic test water in Class I disposal well. The water will be transported off the project site using DOT approved tanker trucks. No upland discharges are planned or intended.

Item i. A request for approval of an alternative treatment, use, and/or discharge location (other than the original discharge site), if necessary;

In the event that the hydrostatic test water is found to be unsuitable for down-hole injection, it will be treated by filtration through activated charcoal and/or other applicable media until it meets the NMOCD standards for down-hole injection and then discharged down-hole.

Item j. A proposed hydrostatic test wastewater sampling plan;

Analytical sampling for the hydrostatic test water will consist of the acquisition of the water quality analysis from the City of Farmington. EPNG will not collect and analyze a pre-test sample of the water obtained from the City of Farmington. Analytical data from the City of Farmington will be used as a baseline to determine if the water is suitable for use.

Prior to hydrostatic testing of the 3201 pipeline, the approximately 140,500 gallons of utility water will be transferred from the City of Farmington into frac-tanks located within EPNG's 3201 pipeline easement (See location information under Item c., and Figures 2 and 3).

After the hydrostatic testing of the 3201 pipeline, the approximately 140,500 gallons of water will be transferred from the pipeline back into the same frac-tanks that were used to store the water. A single pre-disposal 7-point composite sample (one point from each tank) will be collected from these tanks and submitted to an EPA-approved analytical laboratory.

The pre- and post hydrostatic test water samples will be analyzed for corrosivity, ignitability, reactivity, and toxicity, and/or other characterization as required by Key Energy Analytical results of the post hydrostatic test water will be submitted to the NMOCD with a recommendation for disposal of the hydrostatic test water into a Class 1 injection well.

Item k. A proposed method of disposal of fluids and solids after test completion, including closure of any pits, in case the water generated from test exceeds the standards as set forth in Subsections A, B, and C of the 20.6.2.3103 NMAC (the New Mexico Water Quality Control Commission Regulations);

All fluids will be containerized, tested, and then transported for disposal as described under items i. and f. No solid waste is anticipated. In the event that the hydrostatic test water is found to be unsuitable for down-hole disposal, it will be treated by filtration through activated charcoal and/or other media as appropriate until it meets the NMOCD standards for injection into a Class 1 injection well. The injection well is operated by the Farmington office of Key Energy, their contact information is presented below.

Key Energy
5651 U. S. Highway 64
Farmington, NM 87401
Phone: (505) 327-4935

Following disposal characterization, the 1,000 gallons of cleaning solution used to clean the 3201 pipeline before hydrostatic testing will be transported off-site via DOT-approved tanker trucks for treatment and disposal by Mesa Environmental or Thermo-Fluids (see contact information under Item b.).

Item l. A brief description of the expected quality and volume of the discharge;

The hydrostatic test water will be analyzed to assess if the constituent concentrations in the water meet the disposal requirements of Key Energy for their Class 1 injection well. Based on historical data collected from previous hydrostatic test events using similar cleaning techniques before introducing the test water, the quality of the water is expected to meet regulatory limits. The volume of the hydrostatic test water is expected to be approximately 140,500 gallons.

Item m. Geological characteristics of the subsurface at the proposed discharge site;

Regional Features

The water storage location is within the north-central part of the San Juan Basin, a large asymmetric structural depression that contains Paleozoic and Mesozoic sediments up to 15,000 feet thick. The area is characterized by bedrock hillsides and mesas and Pleistocene gravel terraces of the San Juan and Animas Rivers.

Site Geology

The water storage areas are located on alluvium or the Nacimiento, Kirtland or Fruitland Formations. The alluvium in the water storage areas consists of fine to course sands, clays and varying combinations of the two. This alluvium was deposited by both fluvial and eolian action. The soils tend to be weak, compressible and moderately permeable. The thickness of alluvium ranges from less than 3 to more than 75 feet, and drapes the Nacimiento, Kirtland or Fruitland Formations (Stone, et. al., 1983).

Item n. The depth to and total dissolved solids concentration of the ground water most likely to be affected by the discharge;

Regional Hydrogeology

Three ground-water systems are present in the Tertiary and younger sedimentary deposits in this portion of the San Juan Basin.

- Confined aquifers in Tertiary sandstone units.
- Unconfined (water table) aquifers in Tertiary sandstone units near outcrop areas.
- Unconfined (water table) aquifers in the Quaternary alluvium in or near river valleys and tributaries.

Local Groundwater Hydrology. Two groundwater regimes exist near the discharge sites:

1. Unconfined aquifers in the alluvium beneath the water storage areas; and
2. Unconfined sandstone aquifers in the Paleocene Nacimiento Formation or Cretaceous Kirtland or Fruitland Formations below the alluvium (Stone, et. al., 1983).

Groundwater in the vicinity of the discharge may be as shallow as six feet below ground surface in the alluvium or as deep as deep as 235 feet in the Nacimiento Formation (Stone, et. al., 1983).

KLEINFELDER 8300 Jefferson NE, Suite B, Albuquerque, NM 87113 p | 505.344.7373 f | 505.344.1711

Total dissolved solids concentration (derived from specific conductance) in the shallowest water affected by the discharge is between 960 and 3,840 milligrams per liter (iWaters, 2009).

Item o. Identification of landowners at and adjacent to the discharge collection/retention site.

Landowners of the collection/retention sites:

At Blanco Plant (for the cleaning solution retention) and at MP 12 + 1500 (hydrostatic test water staging area):

El Paso Natural Gas Company
2 North Nevada Ave.
Colorado Springs, CO 80903

Landowners along the EPNG right-of-way affected by the hydrostatic testing:

George E. Hutchison
R. D. Golding
Joe O. Campbell
George A. Greenwood
George A. McColm
D. & R. G. W. Railroad
B. E. Dustin
Elbie S. Evans
United States of America (Bureau of Land Management)

Landowners within 1/3-mile of the boundary of the temporary frac-tank storage area on EPNG property within the pipeline easement:

This landowners list is provided in Appendix E and a map showing the locations of these landowners is provided in Appendix F. EPNG it will provide all affected landowners with a brief description of the work involved.

As deemed necessary by NMOCD, a public notice will be posted in accordance with Subsections A, B, D and F of NMAC 20.6.2.3108 at the frac-tank staging areas (Figures 2 and 3), the Farmington, New Mexico Post Office, and published in the Farmington Daily Times newspaper. Copies of the English and Spanish versions of the public notices are presented in Appendix G. EPNG it will provide all affected landowners with a brief description of the work involved.

APPENDIX A
Material Safety Data Sheets for N-Spec 120 Cleaner

Material Safety Data Sheet

Section 1. Chemical Product and Company Identification

Common Name	**N-SPEC 120 Cleaner**
Supplier	Coastal Chemical Co., L.L.C. 3520 Veterans Memorial Drive Abbeville, LA 70510 337-893-3862
Synonym	Not available.
Trade name	Not available.
Material Uses	Not available.
Manufacturer	Coastal Chemical Co., L.L.C. 3520 Veterans Memorial Drive Abbeville, LA 70510 337-893-3862

Code	
MSDS#	Not available.
Validation Date	**9/2/2004**
Print Date	9/2/2004
Responsible Name	**Charles Toups**

In Case of Emergency	Transportation Emergency Call CHEMTREC 800-424-9300 Other Infomation Call Charles Toups 337-261-0796

Section 2. Composition and Information on Ingredients

Name	CAS #	% by Weight	Exposure Limits
Confidential infomation			

Section 3. Hazards Identification

Physical State and Appearance	Liquid.
Emergency Overview	CAUTION! MAY CAUSE EYE IRRITATION. MAY CAUSE SKIN IRRITATION. MAY BE HARMFUL IF SWALLOWED. Keep away from heat, sparks and flame. Avoid contact with eyes. Do not ingest. Avoid prolonged or repeated contact with skin. Keep container closed. Use only with adequate ventilation. Wash thoroughly after handling.
Routes of Entry	Eye contact. Inhalation. Ingestion.
Potential Acute Health Effects	
Eyes	Hazardous in case of eye contact (irritant). Inflammation of the eye is characterized by redness, watering, and itching.
Skin	Irritation of the product in case of skin contact: Not available. Hazardous in case of skin contact
Inhalation	Hazardous in case of inhalation.
Ingestion	Hazardous in case of ingestion.
Potential Chronic Health Effects	**CARCINOGENIC EFFECTS**: Not available. **MUTAGENIC EFFECTS**: Not available. **TERATOGENIC EFFECTS**: Not available.
Medical Conditions Aggravated by Overexposure:	Repeated or prolonged exposure is not known to aggravate medical condition.
Overexposure /Signs/Symptoms	Not available.

See Toxicological Information (section 11)

Continued on Next Page

Section 4. First Aid Measures

Eye Contact	Check for and remove any contact lenses. Immediately flush eyes with running water for at least 15 minutes, keeping eyelids open. Cold water may be used. Get medical attention immediately.
Skin Contact	In case of contact, immediately flush skin with plenty of water for at least 15 minutes while removing contaminated clothing and shoes. Cold water may be used.Wash clothing before reuse. Thoroughly clean shoes before reuse. Get medical attention.
Inhalation	If inhaled, remove to fresh air. If not breathing, give artificial respiration. If breathing is difficult, give oxygen. Get medical attention.
Ingestion	Do NOT induce vomiting unless directed to do so by medical personnel. Never give anything by mouth to an unconscious person. If large quantities of this material are swallowed, call a physician immediately. Loosen tight clothing such as a collar, tie, belt or waistband.
Notes to Physician	Not available.

Section 5. Fire Fighting Measures

Flammability of the Product	Not available
Auto-ignition Temperature	Not available.
Flash Points	Tested - No Flash present
Flammable Limits	Not available.
Products of Combustion	These products are carbon oxides (CO, CO2), sulfur oxides (SO2, SO3...).
Fire Hazards in Presence of Various Substances	Not available.
Explosion Hazards in Presence of Various Substances	Risks of explosion of the product in presence of mechanical impact: Not available. Risks of explosion of the product in presence of static discharge: Not available.
Fire Fighting Media and Instructions	SMALL FIRE: Use DRY chemical powder. LARGE FIRE: Use alcohol foam, water spray or fog. Cool containing vessels with water jet in order to prevent pressure build-up, autoignition or explosion.
Protective Clothing (Fire)	Be sure to use an approved/certified respirator or equivalent.
Special Remarks on Fire Hazards	No additional remark.
Special Remarks on Explosion Hazards	Not available.

Section 6. Accidental Release Measures

Small Spill and Leak	The concentrated form of this material is a cleaner. During application, hazardous material on the apparatus or structure being cleaned may become part of the cleaning solution. Check with all applicable regulations before disposing of the material created during application.
Large Spill and Leak	The concentrated form of this material is a cleaner. During application, hazardous material on the apparatus or structure being cleaned may become part of the cleaning solution. Check with all applicable regulations before disposing of the material created during application.

Continued on Next Page

Section 7. Handling and Storage

Handling	Keep away from heat, sparks and flame. Keep container closed. Use only with adequate ventilation. To avoid fire or explosion, dissipate static electricity during transfer by grounding and bonding containers and equipment before transferring material. Use explosion-proof electrical (ventilating, lighting and material handling) equipment.
Storage	Keep container tightly closed and in a well-ventilated place.

Section 8. Exposure Controls/Personal Protection

Engineering Controls	Provide exhaust ventilation or other engineering controls to keep the airborne concentrations of vapors below their respective threshold limit value. Ensure that eyewash stations and safety showers are proximal to the work-station location.
Personal Protection	
Eyes	Safety glasses.
Body	Lab coat.
Respiratory	Wear appropriate respirator when ventilation is inadequate.
Hands	Impervious gloves.
Feet	Not applicable.
Personal Protection in Case of a Large Spill	Splash goggles. Full suit. Boots. Gloves. Suggested protective clothing might not be sufficient; consult a specialist BEFORE handling this product.

Product Name	Exposure Limits
Confidential infomation	

Consult local authorities for acceptable exposure limits.

Section 9. Physical and Chemical Properties

Physical State and Appearance	Liquid.
Molecular Weight	Not applicable.
Molecular Formula	Not applicable.
pH (1% Soln/Water)	6 to 8 [Neutral.]
Boiling/Condensation Point	The lowest known value is 100°C (212°F) (Water). Weighted average: 140.43°C (284.8°F)
Melting/Freezing Point	May start to solidify at 0°C (32°F) based on data for: Water. Weighted average: -46.19°C (-51.1°F)
Critical Temperature	Not available.
Specific Gravity	0.9 to 0.98 (Water = 1)
Vapor Pressure	The highest known value is 2.3 kPa (17.2 mm Hg) (at 20°C) (Water). Weighted average: 1.17 kPa (8.78 mm Hg) (at 20°C)
Vapor Density	The highest known value is 5.11 (Air = 1). Weighted average: 2.93 (Air = 1)
Volatility	Not available.
Odor Threshold	The highest known value is 34.6 ppm
Evaporation Rate	0.02 compared to Butyl acetate
VOC	Not available.

Odor	Not available.
Taste	Not available.
Color	Blue. (Dark.)

Continued on Next Page

Viscosity	Not available.
$LogK_{ow}$	The product is much more soluble in water.
Ionicity (in Water)	Anionic.
Dispersion Properties	See solubility in water, methanol, diethyl ether.
Solubility	Easily soluble in cold water, hot water, methanol, diethyl ether. Insoluble in n-octanol.
Physical Chemical Comments	Not available.

Section 10. Stability and Reactivity

Stability and Reactivity	The product is stable.
Conditions of Instability	Not available.
Incompatibility with Various Substances	Reactive with oxidizing agents, acids. Slightly reactive to reactive with reducing agents.
Hazardous Decomposition Products	Not available.
Hazardous Polymerization	Will not occur.

Section 11. Toxicological Information

Toxicity to Animals	Acute oral toxicity (LD50): 1900 mg/kg [Rat]. Acute dermal toxicity (LD50): 9510 mg/kg [Rabbit].
Chronic Effects on Humans	No additional remark.
Other Toxic Effects on Humans	Hazardous in case of eye contact (irritant), of ingestion, of inhalation. Hazardous in case of skin contact (irritant). Slightly hazardous in case of skin contact (sensitizer).
Special Remarks on Toxicity to Animals	Not available.
Special Remarks on Chronic Effects on Humans	Not available.
Special Remarks on Other Toxic Effects on Humans	Material is irritating to mucous membranes and upper respiratory tract.

Section 12. Ecological Information

Ecotoxicity	Not available.
BOD5 and COD	Not available.
Biodegradable/OECD	Not available.
Mobility	Not available.
	These products are carbon oxides (CO, CO_2) and water, nitrogen oxides (NO, NO_2...), sulfur oxides (SO_2, SO_3...), phosphates. Some metallic oxides.
Toxicity of the Products of Biodegradation	The products of degradation are less toxic than the product itself.

Continued on Next Page

Special Remarks on the Products of Biodegradation	Not available.

Section 13. Disposal Considerations

Waste Information	Waste must be disposed of in accordance with federal, state and local environmental control regulations.
Waste Stream	Not available.

Consult your local or regional authorities.

Section 14. Transport Information

Shipping Description	Not a DOT controlled material (United States). Not regulated.
Reportable Quantity	11061.8 lbs. (5016.7 kg)
Marine Pollutant	Not regulated - Alkylaryl sulfonate amine salt - less then 10 % .
Special Provisions for Transport	Contains alkylbenzenesulfonate

Section 15. Regulatory Information

HCS Classification	CLASS: Target organ effects.
U.S. Federal Regulations	TSCA 8(a) PAIR: contains Alkylbenzenesulfonate SARA 302/304/311/312 extremely hazardous substances: No products were found. SARA 302/304 emergency planning and notification: No products were found. SARA 302/304/311/312 hazardous chemicals: No products were found. SARA 311/312 MSDS distribution - chemical inventory - hazard identification: No products were found. SARA 313 toxic chemical notification and release reporting: No products were found. Clean Water Act (CWA) 307: No products were found. Clean Water Act (CWA) 311: No products were found. Clean air act (CAA) 112 accidental release prevention: No products were found. Clean air act (CAA) 112 regulated flammable substances: No products were found. Clean air act (CAA) 112 regulated toxic substances: No products were found.
International Regulations	
EINECS	Not available.
DSCL (EEC)	Risk to eyes. May cause irriationby skin contact. R322- May be harmful if swallowed. R36/38- Irritating to eyes and skin.
International Lists	No products were found.
State Regulations	Pennsylvania RTK: Dipropylene glycol monomethyl ether; Trade Secret; Gylcol Ether PNB Florida: Dipropylene glycol monomethyl ether; Ethanol Minnesota: Dipropylene glycol monomethyl ether Massachusetts RTK: Dipropylene glycol monomethyl ether; Ethanol New Jersey: Ethanol; Gylcol Ether PNB **WARNING:** This product contains the following ingredients for which the State of California has found to cause birth defects which would require a warning under the statute: Ethanol

Notice to Reader

To the best of our knowledge, the information contained herein is accurate. However, neither the above named supplier nor any of its subsidiaries assumes any liability whatsoever for the accuracy or completeness of the information contained herein. Final determination of suitability of any material is the sole responsibility of the user. All materials may present unknown hazards and should be used with caution. Although certain hazards are described herein, we cannot guarantee that these are the only hazards that exist.

APPENDIX B
Certification of Siting Criteria

1 Certification of Siting Criteria

Hydrostatic Testing of Line 3201

On January 13, I, Nestor C. Vigil, performed a site visit to look for the presence of the items listed below. Some were observed within the specified distance for each item listed below from the edge of the pipeline right of way to site where the water storage tanks will be located at mile post 12 + 1500 on Line 3201 in San Juan County, NM. The hydro-test water will also be introduced to the pipeline at this site. A note beside each item below describes my observations.

i. Within 200 feet of a watercourse, lakebed, sinkhole, or playa lake; *NOTE: The actual Animas River is further than this distance.*

ii. Within 1,000 feet of an existing wellhead protection area or 100-year floodplain; *NOTE : I will defer to the statement and research from our consultant, Kleinfelder. This information is included as part of the NOI.*

iii. Within, or within 500 feet of, a wetland; *NOTE: Yes, the Animas River's green belt (the bosque) is a distance of 435 feet.*

iv. Within the area overlying a subsurface mine; *NOTE: No.*

v. Within 500 feet from the nearest permanent residence, school, hospital, institution or church. *NOTE: Yes. The nearest home (mobile home) is north of the site and is 90 feet from where the tanks are planned to be staged.*

On behalf of El Paso Natural Gas, I state that the above information is complete and true to the best of my knowledge.

Nestor C. Vigil, Jr.
Senior Technician

To: "Marco Wikstrom" <MWikstrom@kleinfelder.com>
Date: 12/30/2009 10:13 AM
Subject: RE: Abandoned Mines in Farmington

Marco,

I have no record on any abandoned mines in the three sections you mentioned. But just a reminder that there are many abandoned mines out there that we don't know about.

Hope this helps.

Mike Tompson
New Mexico Abandoned Mine Land Program
(505) 476-3427

From: Marco Wikstrom [mailto:MWikstrom@kleinfelder.com]
Sent: Wednesday, December 30, 2009 10:03 AM
To: Tompson, Mike, EMNRD
Subject: Abandoned Mines in Farmington

Mike,

We're doing another hydrostatic test in the Farmington area and need to know if there are any known abandoned mines in the following areas:

S-1, T-29N, R-13W

S-6, T-29N, R-12W

S-14, T-29N, R-11W

Thanks.

Marco

Public Notice Text in Spanish and English

AVISO PÚBLICO

El Ministerio de Transporte de Estados Unidos (USDOT) requiere pruebas de presión periódicas en todas las tuberías reguladas por el USDOT-reguladas. La compañía de El Paso Natural Gas (EPNG) da por este medio el aviso que el uso siguiente del permiso de la descarga se ha sometido a la división de la conservación de aceite del Nuevo México (NMOCD) de acuerdo con la subdivisión A, B, D, y F del código administrativo de 20.6.2.3108 Nuevo México. La dirección local del correo de EPNG es: El Paso Natural Gas, San Juan Area Office, P.O. Box 127, Bloomfield, NM 87413.

El Paso Natural Gas ha presentado una solicitud para conductor una hidrostática del agua de la tubería 3201 de la prueba que ocurrirá en la servidumbre de EPNG en sección 1 del municipio 29 del norte, se extiende 13 del oeste, y las secciones 6, 7, 8 del municipio 29 del norte, se extiende 12 del oeste, en el condado de San Juan, Nuevo México. El propósito de hidrostático (prueba con agua) es para determinar el grado a los defectos potenciales pudieron amenazar a la capacidad de la tubería de sostener la presión máxima permitida de la operación. La prueba implica el purgar del gas natural de la tubería, limpiando la tubería con un quitamanchas acuoso, no-peligroso, rellenar la tubería con agua, después presurizando la tubería a una presión más alta que la presión de funcionamiento estándar para una duración especificada del tiempo.

Una porción de la tubería de EPNG 3201 hidrostático será probada. Antes de la prueba hidrostática, la tubería será limpiada usando aproximadamente 1.000 galones de un quitamanchas acuoso y no-peligroso, N-Spec. 120. El volumen de solución de la limpieza se estima para ser 1.000 galones y será almacenado en un o dos frac-tanques en la estaciones del compresor de EPNG; Estación del compresor de Blanco. La estación del compresor de Blanco está situada en el N/2 del N/2, sección 14, el municipio 29 del norte, se extiende 13. Una muestra compuesta de la solución de la limpieza será analizada para la corrosividad, el encienda, la reactividad, y la toxicidad además de los estándares de Mesa Ambiental o Thermo Fluids, Inc la Comisión del control de calidad del agua del nanómetro (WQCC) descritos más abajo. La solución de la limpieza puede almacenar en el frac-tanque por dos semanas con una opción por dos semanas adicionales de almacenaje. Esta agua será transportada para la disposición apropiada al Mesa Ambiental en Belen, Nuevo México o Thermo Fluids, Inc. en Albuquerque, Nuevo México.

Hasta 140.500 galones de agua inusitada fresca, de la ciudad de las utilidades de Farmington, serán almacenados inicialmente en los tanques de 21.000 galones (los frac-tanques) situados en el SE/4 del NE/4 del sección 1, el municipio 29 del norte, se extiende 13 del oeste en la proporidad de EPNG, approximente 700 pies suroeste de la interseccion de Gila Calle y Camino de Engles. Después de la prueba hidrostática, las mangueras y/o las pipas flexibles serán utilizadas para transferir la agua usada de la prueba en los tanques del frac situados en las estaciones del compresor de Río Vista. Tanto como los 7 tanques del frac pueden ser necesarios para contener temporalmente hasta 140.500 galones de agua usada de la prueba. Esta agua será analizada para asegurarse que cumplio los estándares de Key Energy. De la prueba se puede almacenar en los tanques del frac por dos semanas con una opción por dos semanas adicionales de almacenaje, hasta que finalicen resultados analíticos. El agua hidrostática de la prueba no será descargada. Después del recibo de la aprobación de NMOCD, será transportada e inyectada correctamente en un pozo de inyección permitido de la clase 1 funcionado por Key Energy de Farmington, Nuevo México.

La agua subterránea más baja probablemente que se afectará por un escape, una descarga accidental, o un derramamiento existe en una profundidad de 6 pies debajo de la superficie de tierra. Esta sistema del acuífero tiene una concentración total de los sólidos en suspensión entre de aproximadamente 960 y 3.840 miligramos por litro o mayor (calculado de conductancia especifica divulgada entre de 1.500 y 6.000 µS/cm).

El aviso del intento esquemas cómo el agua y la basura producidas serán manejadas correctamente, incluyendo la dirección, almacenaje, y la disposición final. El aviso del intento también incluye los procedimientos para la gerencia apropiada de escapes, de descargas accidentales, y de derramamientos para proteger las aguas del estado de Nuevo México.

Para la información adicional, para ser colocado en una lista de personas a quienes se mandan propaganda facilidad-especifica para los avisos futuros, o someter los comentarios satisfacen entran en contacto con:

Brad Jones, ingeniero ambiental
New Mexico Energy, Minerals and Natural Resources Department
Oil Conservation Division
1220 South St. Francis Drive
Santa Fe, NM 87505
Teléfono: (505) 476-3487

La energía del nanómetro y el Deprtamento de los Recursos Naturales y Minerales aceptarán comentarios y declaraciones del interés con respecto a esta prueba hidrostática y proporcionarán los avisos futuros para esta tubería a petición.

PUBLIC NOTICE

The United States Department of Transportation (USDOT) requires periodic pressurized tests on all USDOT-regulated pipelines. El Paso Natural Gas Company (EPNG) hereby gives notice that the following discharge permit application has been submitted to the NM Oil Conservation Division (NMOCD) in accordance with Subsection A, B, D and F of 20.6.2.3108 of New Mexico Administrative Code (NMAC). The local EPNG mailing address is: El Paso Natural Gas, San Juan Area Office, P.O. Box 127, Bloomfield, NM 87413.

EPNG has submitted an application to perform a hydrostatic test of the 3201 Pipeline on the EPNG pipeline easement in Section 1, Township 29 North, Range 13 West, and Sections 6, 7, and 8 of Township 29 North, Range 12 West, in San Juan County, New Mexico. The purpose of hydrostatic (testing with water) is to determine the extent to which potential defects might threaten the pipeline's ability to sustain maximum allowable operation pressure. The test involves purging the natural gas from the pipeline, cleaning the pipeline with an aqueous, non-hazardous cleaning fluid, filling the pipeline with water, then pressurizing the pipeline to a pressure higher than the standard operating pressure for a specified duration of time.

A portion of the EPNG 3201 pipeline will be hydrostatically tested. Prior to hydrostatic testing, the pipeline will be cleansed using approximately 1,000 gallons of an aqueous and non-hazardous cleaning fluid, N-Spec 120. The volume of cleaning solution is estimated to be 1,000 gallons and it will be stored in one or two 21,000 gallon frac-tanks at EPNG's Blanco compressor station located in the N/2 of the N/2, Section 14, Township 29 North, Range 11 West. A composite sample of the cleaning solution will be analyzed for corrosivity, ignitability, reactivity, and toxicity for disposal characterization as required by Mesa Environmental or Thermo Fluids, Inc. The water/cleaning solution mixture may be stored in the frac-tanks for two weeks with the option to store it for an additional two weeks. This water will be transported for proper disposal to the Mesa Environmental regional processing facility in Belen, NM or Thermo Fluids, Inc. in Albuquerque, NM.

Up to 140,500 gallons of fresh unused water, from City of Farmington, will be initially stored in as many as seven 21,000-gallon tanks (frac-tanks) located in the SE/4 of the NE/4 of Section 1, Township 29 North, Range 13 West within EPNG's property approximately 700 feet southwest of the intersection of Gila Street and English Road within the City of Farmington. Following hydrostatic testing, hoses and/or flexible pipes will be used to transfer the used test water into the frac-tanks. A composite sample of this water will be analyzed by an EPA-approved analytical laboratory for waste characterization analysis for corrosivity, ignitability, reactivity, and toxicity, and/or other characterization as required by Key Energy. Used test water may be stored in the frac-tanks for two weeks with the option to store it for an additional two weeks. The hydrostatic test water will not be discharged. After receipt of NMOCD approval, it will be properly transported and injected into a permitted Class 1 injection well operated by Key Energy of Farmington, NM.

The shallowest groundwater likely to be affected by a leak, accidental discharge, or spill exists at a depth of 6 feet below the ground surface. This aquifer system has a total dissolved solids concentration of between approximately 960 and 3,840 milligrams per liter or greater (calculated from reported specific conductance of between 1,500 and 6,000 µS/cm).

The notice of intent outlines how produced water and waste will be properly managed, including handling, storage, and final disposition. The plan also includes procedures for the proper management of leaks, accidental discharges, and spills to protect the waters of the State of New Mexico.

For additional information, to be placed on a facility-specific mailing list for future notices, or to submit comments please contact:

Brad Jones, Environmental Engineer
New Mexico Energy, Minerals and Natural Resources Department
Oil Conservation Division
1220 South St. Francis Drive
Santa Fe, NM 87505
Phone: (505) 476-3487

The NM Energy, Minerals and Natural Resources Department will accept comments and statements of interest regarding this hydrostatic test and will provide future notices for this pipeline upon request.

Karen Aicher - RE: WP for EPNG

From: Patricia Dan
To: David Janney; Debbie Gonzales
Date: 1/20/2010 1:48 PM
Subject: RE: WP for EPNG

Dave,

Final figures 1, 2, and 3 are located at G:\Environ\CURRENT WORK FOLDER PROJECTS\83107 - EPNG NM Pipeline Hydrostatic Discharge Plans\4.0 Technical Information\Task 4-3201 Pipeline Discharge Permit\Figures\Finals and the FEMA map is at G:\Environ\CURRENT WORK FOLDER PROJECTS\83107 - EPNG NM Pipeline Hydrostatic Discharge Plans\4.0 Technical Information\Task 4-3201 Pipeline Discharge Permit\Final\Final NOI\Appendix D.

Any questions, please let me know.

thanks, Patricia

NOTICE OF PUBLICATION

STATE OF NEW MEXICO
ENERGY, MINERALS AND NATU - RAL RESOURCES DEPARTMENT
OIL CONSERVATION DIVISION

Notice is hereby given that pursuant to New Mexico Water Quality Control Commission Regulations (20.6.2,3108 NMAC), the following discharge permit application(s) has been submitted to the Director of the Oil Conservation Division ("OCD"), 1220 S. Saint Francis Drive, Santa Fe, New Mexico 87505, Telephone (505) 476-3440:

(HIP-115) Mr. Richard Durante of El Paso Natural Gas Company (EPNG), 8725 Alameda Park Dr. NE, Albuquerque, New Mexico 87120, has submitted an application for an Individual Hydrostatic Test Discharge Permit to the New Mexico Energy, Minerals and Natural Resources Department, Oil Conservation Division (OCD) for hydrostatically testing approximately 8,560 feet of an existing 20-inch natural gas transmission pipeline (EPNG 3201), within municipal limits of the City of Farmington, New Mexico. EPNG will obtain water for the hydrostatic test from the City of Farmington. Prior to the hydrostatic test, EPNG will clean the pipeline using approximately 1,000 gallons of an aqueous and non-hazardous cleaning fluid, N-Spec 120. The cleaning solution will be removed from the pipeline and temporarily stored in a frac-tank at EPNG's Blanco compressor station located in the N/2 of the N/2, Section 14, Township 29 North, Range 11 West. The cleaning solution will be analyzed for corrosivity, ignitability, reactivity, and toxicity for disposal characterization. The cleaning solution will be transported for recycling and proper disposal to Mesa Environmental in Belen, NM or Thermo Fluids, Inc. in Albuquerque, NM. EPNG will remove the hydrostatic test wastewater from the pipeline and temporarily store in seven 21,000-gallon frac-tanks within EPNG's pipeline easement right-of- way at MP-12 of the SE/4 of the NE/4 of Section 1, Township 29 North, Range 13 West. The location of the discharge for collection and retention is approximately 700 feet southwest of the intersection of Gila Street and English Road within the City of Farmington. EPNG proposes to dispose of the hydrostatic test wastewater into a Class I injection well. No surface discharge is proposed. Approximately 140,500 gallons of wastewater will be generated from the hydrostatic test, and analyzed for corrosivity, ignitability, reactivity, and toxicity for disposal characterization. After receipt of OCD's approval, the wastewater will be properly transported and injected into a permitted Class 1 injection well operated by Key Energy of Farmington, NM. The shallowest groundwater most likely to be affected by an accidental discharge is at a depth of approximately 6-feet below ground surface with a total dissolved solids concentration of approximately 960 to 3,840 mg/l. The plan consists of a description of the method and location for retention, and testing of water and solids, including how spills, leaks, and other accidental discharges to the surface will be managed in order to protect fresh water.

The OCD has determined that the application is administratively complete and has prepared a draft permit. The OCD will accept comments and statements of interest regarding this application and will create a facility-specific mailing list for persons who wish to receive future notices. Persons interested in obtaining further information, submitting comments or requesting to be on a facility-specific mailing list for future notices may contact the Environmental Bureau Chief of the Oil Conservation Division at the address given above. The administrative completeness determination and draft permit may be viewed at the above address between 8:00 a.m. and 4:00 p.m., Monday through Friday, or may also be viewed at the OCD web site http://www.emnrd.state.nm.us/ocd/. Persons interested in obtaining a copy of the application and draft permit may contact the OCD at the address given above. Prior to ruling on any proposed discharge permit or major modification, the Director shall allow a period of at least thirty (30) days after the date of publication of this notice, during which interested persons may submit comments or request that OCD hold a public hearing. Requests for a public hearing shall set forth the reasons why a hearing should be held. A hearing will be held if the Director determines that there is significant public interest.

If no public hearing is held, the Director will approve or disapprove the proposed permit based on information available, including all comments received. If a public hearing is held, the director will approve or disapprove the proposed permit based on information in the permit application and information submitted at the hearing.

Re: Hydrostatic Test Discharge Permit HIP-115
El Paso Natural Gas Company
Pipeline Number 3201
Locations: N/2 of the N/2, Section 14, Township 29 North, Range 11 West and the SE/4 of the NE/4 of Section 1, Township 29 North, Range 13 West, NMPM
San Juan County, New Mexico

Dear Mr. Duarte:

The New Mexico Oil Conservation Division (OCD) has received El Paso Natural Gas Company's (EPNG) revised notice of intent, dated January 7, 2010, for authorization to temporary store approximately 140,500 gallons of wastewater generated from a hydrostatic test of approximately 8,560 feet of an existing 20-inch natural gas transmission pipeline (EPNG 3201), within municipal limits of the City of Farmington, New Mexico and to temporary store approximately 1,000 gallons of cleaning solution wastewater generated from pre-cleaning the pipeline prior to the hydrostatic test of the 20-inch natural gas transmission pipeline (EPNG 3201), east and southeast of Bloomfield, New Mexico. The proposed collection locations are at EPNG's Blanco "A" compressor station located in the N/2 of the N/2, Section 14, Township 29 North, Range 11 West for the cleaning solution and within EPNG's pipeline easement right-of-way at MP-12 in the SE/4 of the NE/4 of Section 1, Township 29 North, Range 13 West for the hydrostatic test wastewater. EPNG proposes to dispose of the hydrostatic test wastewater into a Class I injection well and transport the cleaning solution wastewater to a recycling facility. No surface discharge is proposed. The submittal provided the required information in order to deem the application "administratively" complete. The OCD approves the Farmington Daily Times as the newspaper of general circulation for the published notice and the collection/retention locations (Blanco "A" compressor station and approximately 700 feet southwest of the intersection of Gila Street and English Road within EPNG's easement right-of-way) and the post office in Bloomfield, New Mexico as proposed posting locations.

Therefore, the July 2006 New Mexico Water Quality Control Commission (WQCC) regulations notice requirements (20.6.2.3108 NMAC) must be satisfied and demonstrated to the OCD. The hydrostatic test event shall not be initiated until EPNG's and OCDs notice periods pass, the permit is issued, and the additional permit fee is paid.

If there are any questions regarding this matter, please do not hesitate to contact me at (505) 476-3487 or brad.a.jones@state.nm.us.

Sincerely,

Brad A. Jones
Environmental Engineer

KLEINFELDER
Bright People. Right Solutions.

January 7, 2010
File No. 83107.4-ALB09RP001

Mr. Brad Jones
New Mexico Energy, Minerals, and Natural Resources Department
Oil Conservation Division
1220 St. Francis Drive
Santa Fe, NM 87505

Subject: Submittal of a Notice of Intent to Perform a Hydrostatic Test
Pipeline Number 3201
San Juan County, New Mexico

Dear Mr. Jones:

On behalf of the El Paso Natural Gas Company (EPNG), Kleinfelder West, Inc. (Kleinfelder) is pleased to submit this Notice of Intent (NOI) for a hydrostatic test of the 3201 Pipeline. EPNG is intending to dispose of the used hydrostatic test water into a Class 1 injection well therefore; no surface discharge of hydrostatic test water is planned.

As required by US DOT Pipeline and Hazardous Materials Safety Administration regulations, EPNG is planning to conduct pipeline reconditioning work on its 20-inch 3201 pipeline near Farmington, New Mexico in mid to late February 2010. EPNG will be hydrostatically testing approximately 8,560 feet of used and new pipe on this pipeline.

Kleinfelder has included the required information for the NOI as stated in the "Guidelines for Hydrostatic Test Dewatering" Dated January 11, 2007. Attached to this NOI are the following:

- Background Information;
- Notice of Intent Plan;
- Figure 1, EPNG 3201 Pipeline Undergoing Hydrostatic Test;
- Figure 2, Temporary Frac-Tank Staging Location, Hydrostatic Test Water;
- Figure 3, Temporary Frac-Tank Staging Location, Cleaning Solution;
- Appendix A, Material Safety Data Sheets for N-Spec 120 Cleaner;
- Appendix B, Certification of Siting Criteria;
- Appendix C, Copy of Email from the New Mexico Abandoned Mine Lands Program;
- Appendix D, Federal Emergency Management Administration Flood Insurance Rate Maps;
- Appendix E, List of Landowners within 1/3 mile of the Pipeline Segments undergoing hydrostatic testing;
- Appendix F, Map of Landowners within 1/3 mile of the Pipeline Easement; and
- Appendix G, Public Notice text in Spanish and English

A check in the amount of $100.00 to cover the filing fee is included with this filing. As deemed necessary by the NMOCD, public notice will be posted in accordance with Subsections A, B,

8300 Jefferson NE, Suite B, Albuquerque, NM 87113 p | 505.344.7373 f | 505.344.1711

and C of NMAC 20.6.2.3108 at the frac-tank staging areas (Figures 2 and 3), the Farmington, New Mexico Post Office, and published in the Farmington Daily Times newspaper.

Kleinfelder prepared this NOI in a manner consistent with the level of care and skill ordinarily exercised by other members of Kleinfelder's profession practicing in the same locality, under similar conditions and at the date the services are provided. The information provided in this document is based on our understanding of the information provided by EPNG. The work performed was based on project information provided by EPNG.

Should you have any questions, please feel free to contact David Janney or Marco Wikstrom (Kleinfelder) at (505) 344-7373, or Richard Duarte (EPNG) at (505) 831-7763.

Respectfully submitted,
KLEINFELDER WEST, INC.

David Janney, PG
Project Manager

Background Information

- The EPNG Pipeline number 3201 is an existing 20-inch (outside diameter) natural gas pipeline that has been in service since 1953.
- This transportation pipeline is part of a network that transports natural gas (sweet and dry) that is suitable for immediate consumer use.
- Based upon recent experience with the NMOCD, EPNG understands that the water used for cleaning and testing this pipeline system is generally classified as non-exempt RCRA waste and is subject to the Water Quality Control Commission (WQCC) Regulations.

Notice of Intent Plan

On behalf of EPNG, Kleinfelder is submitting this NOI plan as outlined in NMOCD Guidance document, "Guidelines for Hydrostatic Test Dewatering," (revised January 11, 2007). The NOI plan includes the following items:

Item a. Name and address of the proposed discharger;

Legally Responsible Party	Sam A. Armenta, Director El Paso Natural Gas Company Albuquerque Division 8725 Alameda Park Dr. NE Albuquerque, NM 87120
Local Representative	Richard Duarte (505) 831-7763 El Paso Natural Gas Company 8725 Alameda Park Dr. NE Albuquerque, NM 87120
Operator	
Physical Address	El Paso Natural Gas Company San Juan Area Office #81 County Road 4900 Bloomfield, NM 87413
Mailing Address	El Paso Natural Gas Company San Juan Area Office P.O. 127 Bloomfield, NM 87413

Item b. Location of the discharge, including a street address, if available, and sufficient information to locate the facility with respect to surrounding landmarks;

The location of the portions of the 3201 pipeline to be hydrostatically tested is shown on figure 1. The segment of 3201 pipeline that will be hydrostatically tested is immediately west of the Animas River and within the City of Farmington and goes east of County Road 3000 by

approximately 1-1/4 –mile. Approximately 7 frac-tanks will be located 700 feet southwest of the intersection of Gila Street and English Road within EPNG owned property along the 3201 Pipeline. Coordinates for this location are Latitude 36° 45' 25.64" North, Longitude 108° 08' 58.29" West.

Prior to the hydrostatic test, the pipeline will be cleaned to remove oil residue and other trace contaminants. The segment will generate water (RCRA non-exempt) subject to regulation by the WQCC. There will be a small volume of water mixed with pipe cleaning liquid (N-Spec 120, see Appendix A for material safety data sheet). The volume of cleaning solution is estimated to be 1,000 gallons. The source of water mixed with the pipe cleaning liquid will be public utility drinking water from the City of Farmington.

The pipe cleaning solution will be used to clean the entire 3201 pipeline, mile post (MP) 0 to MP 22 and will be stored at EPNG's Blanco Compressor Station (GW-49-0, Figure 3). After cleaning the pipeline, the cleaning solution will be moved from the pipeline directly into a frac-tank (stored within secondary containment), then transferred into tank trucks for transportation to a recycling facility.

The temporary frac-tank storage location for the cleaning solution will be:

Mile post 0 + 0000' is located at the discharge side of Blanco Compressor Station (south side of the station), County Road 4900, #81, Bloomfield, NM 87413. This is locally known as "gasoline alley" road. Coordinates for this location are Latitude 36° 43' 44.55" North, Longitude 107° 57' 40.12" West. The temporary storage area is within the compressor station boundary. There will be one 21,000-gallon temporary tank with the water/N-SPEC mixture at this location and the liquid may be stored for up to two weeks. In the event that laboratory analysis or removal transportation is delayed, EPNG will request an additional two weeks of storage time. Every effort will be made to remove the liquid within two weeks. A 21,000-gallon tank is required to contain the high pressure discharge (above 850 pounds per square inch) and high flow rates utilized to drain the 3201 pipeline. The temporary frac-tank storage area at Blanco is shown on Figure 3.

The permitted recycling facilities that will be used for the cleaning solution are:

Mesa Environmental, a Division of Mesa Oil, Inc.
Corporate - 17300 Hwy 72, Arvada, CO 80007
Regional Processing Facility – 20 Lucero Road, Belen, NM 87002

Or,

Thermo Fluids Inc.
Corporate – 8925 E. Pima Center Pkwy, Suite 105, Scottsdale, AZ 85258
Local Office – 9010 Bates Road, SW, Albuquerque, NM 87105

After the pipeline has been cleaned, public utility drinking water from the City of Farmington, NM will be used to perform hydrostatic testing of the segment of the 3201 pipeline. The segment is as follows; from MP 12 + 1500 in Section 6, Township 29N, Range 12W, to MP 13 +4780 in Section 7, Township 29N, Range 12W (Figure 2). Approximately 140,500 gallons of water will be used for the hydrostatic test.

Upon completion of the hydrostatic test, EPNG will generate a second volume of water (RCRA non exempt) that may be subject to regulation: the hydrostatic test water. The test water will be initially transferred into clean portable frac-tanks (stored within secondary containment) and held

at one location (Figure 2). Due to an enhanced pipeline cleaning protocol EPNG believes that the hydrostatic test water may meet the WQCC standards for ground water with contaminant concentrations not exceeding levels listed in Subsections A, B, and C of NMAC 20.6.2.3103.

Item c. Legal description of the discharge location;

Introduction, removal, and storage of hydrostatic test water will occur in the staging area at the following location:

S/2 of Section 1, Township 29 North, Range 13 West, in San Juan County, New Mexico (See Figure 2)

Introduction, removal, and storage of cleaning solution will occur at the following location:

N/2 of the N/2 Section 14, Township 29 North, Range 11 West in San Juan County, New Mexico (See Figure 3).

Item d. Maps (site-specific and regional) indicating the location of the pipelines to be tested;

Figure 1 is a site-specific map showing topography, the pipeline sections undergoing test, and the hydrostatic test water staging area. Figure 2 is a larger scale site-specific map showing the hydrostatic test water storage location. Figure 3 is a larger scale site-specific map showing the pipeline cleaning solution storage location.

Item e. A demonstration of compliance to the following siting criteria or justification for any exceptions:

- ***i. Within 200 feet of a watercourse, lakebed, sinkhole, or playa lake;***
- ***ii. Within 1,000 feet of an existing wellhead protection area or 100-year floodplain;***
- ***iii. Within, or within 500 feet of, a wetland;***
- ***iv. Within the area overlying a subsurface mine; or***
- ***v. Within 500 feet from the nearest permanent residence, school, hospital, institution or church.***

According to Mr. Mike McCown, EPNG's Cross-Functional Technician, evidence of the above listed features is present within the required radius limits of the proposed staging area of hydrostatic test water. Mr. McCown performed a site visit to look for the presence of watercourses, lakebeds, sinkholes, playa lakes, wells, wetlands, residences, schools, hospitals, institutions, mines and churches. According to Mr. McCown, some these items were observed within the specified distances listed under Item e. A Certification of Siting Criteria from Mr. McCown is attached in Appendix B.

A search for surrounding water wells was completed to satisfy a portion of this requirement. The New Mexico Water Rights Reporting System (NMWRRS, [iWaters]) database at the New Mexico Office of the State Engineer was used for this search, which was conducted on December 30, 2009. According to the search, a single water well may be located within 1,000 feet of the proposed cleaning solution storage area. This well, point of diversion number 1426,

is located in the SE/4, NW4, Section 14, Township 29N, Range 11W. It is unknown if this well is active, inactive, or abandoned. No water storage area will be located within 1,000 feet of a well head protection area.

Mr. Mike Tompson with the New Mexico Abandoned Mine Lands Program (505-476-3427) was contacted to assess the presence of abandoned subsurface mines in the vicinity of the water storage tank staging areas. According to Mr. Tompson, there is no record of abandoned subsurface mines in these areas. A copy of an email from Mr. Tompson is attached in Appendix C.

Federal Emergency Management Administration (FEMA) flood insurance rate maps were generated from the FEMA website to search for 100-year floodplains in the proposed hydrostatic test water and cleaning solution storage areas. According to the FEMA website no storage tank locations are within a floodplain. The FEMA flood insurance rate maps are attached under Appendix D.

Item f. A brief description of the activities that produce the discharge;

Pressure testing with water, known as hydrostatic testing, is one of the tools pipeline operators use to verify pipeline integrity. The test involves purging the natural gas from the pipeline, cleaning the pipeline with an aqueous, non-hazardous cleaning fluid, filling the pipeline with water, then pressurizing the pipeline to a pressure higher than the standard operating pressure for approximately nine hours. The purpose of hydrostatic testing in a pipeline is to determine the extent to which potential defects might threaten the pipeline's ability to sustain maximum allowable operation pressure. If leaks or breaks occur, the pipeline is repaired or the affected areas is replaced and then re-tested. The U.S. Department of Transportation Pipeline and Hazardous Materials Safety Administration (PHMSA) requires periodic pressurized tests on all DOT-regulated pipelines and all newly installed pipelines to verify the integrity and safety of pipeline systems. Approximately 140,500 gallons of public utility water from the City of Farmington will be used for the hydrostatic test and pipeline cleaning.

Item g. The method and location for collection and retention of fluids and solids;

The approximately 1,000 gallons of N-Spec 120 cleaning solution used to clean the pipeline will be moved from the frac tank via hoses and/or flexible pipe and routed directly to the pipeline at the Blanco compressor station (Figure 3).

After cleaning the pipeline, the entire volume of N-Spec 120 cleaning solution will be transferred back into the frac tank and a pre-disposal composite sample will be collected and submitted to an EPA-approved analytical laboratory for waste characterization, including analysis for corrosivity, ignitability, reactivity, and toxicity, and/or other characterization as required by Mesa Environmental or Thermo-Fluids (see contact information under Item b.).

The approximately 140,500 gallons of water used for hydrostatic testing of the 3201 pipeline will be removed from the pipeline via hoses and/or flexible pipe using drip pans under the connection points and stored in 7 frac-tanks with secondary containment at the hydrostatic test water storage area (Figure 2). When not in use, all individual tank valves will be closed and locked. Solids are not anticipated to be produced from the hydrostatic testing. EPNG also plans to have the frac-tank staging area under 24-hour security surveillance.

Item h. A brief description of best management practices to be implemented to contain the discharge onsite and to control erosion;

EPNG intends to discharge the hydrostatic test water in Class I disposal well. The water will be transported off the project site using DOT approved tanker trucks. No upland discharges are planned or intended.

Item i. A request for approval of an alternative treatment, use, and/or discharge location (other than the original discharge site), if necessary;

In the event that the hydrostatic test water is found to be unsuitable for down-hole injection, it will be treated by filtration through activated charcoal and/or other applicable media until it meets the NMOCD standards for down-hole injection and then discharged down-hole.

Item j. A proposed hydrostatic test wastewater sampling plan;

Analytical sampling for the hydrostatic test water will consist of one 6 or 7-point composite pre-test (depending on the number of frac-tanks used) sample collected from the municipal water stored in the frac-tanks and one 6 or 7 -point composite pre-disposal sample.

Analytical data from the pre-hydrostatic test water will be used as a baseline to determine if the water is suitable for use. Analytical data from the post-hydrostatic test water will be used to determine if the water is suitable for injection well disposal.

Prior to hydrostatic testing of the 3201 pipeline, the approximately 140,500 gallons of utility water will be transferred from the City of Farmington into frac-tanks located within EPNG's 3201 pipeline easement (See location information under Item c., and Figures 2 and 3). A single pre-test composite sample will be collected from these tanks and submitted to an EPA-approved analytical laboratory.

After the hydrostatic testing of the 3201 pipeline, the approximately 140,500 gallons of water will be transferred from the pipeline back into the same frac-tanks that were used to store the water. A single pre-disposal 7-point composite sample (one point from each tank) will be collected from these tanks and submitted to an EPA-approved analytical laboratory.

The pre- and post hydrostatic test water samples will be analyzed for the constituents outlined in Subsections A, B, and C of NMAC 20.6.2.3103. Analytical results of the pre-discharge sample will be submitted to the NMOCD with a recommendation for disposal of the hydrostatic test water into a Class 1 injection well.

Item k. A proposed method of disposal of fluids and solids after test completion, including closure of any pits, in case the water generated from test exceeds the standards as set forth in Subsections A, B, and C of the 20.6.2.3103 NMAC (the New Mexico Water Quality Control Commission Regulations);

All fluids will be containerized, tested, and then transported for disposal as described under items i. and f. No solid waste is anticipated. In the event that the hydrostatic test water is found to be unsuitable for down-hole disposal, it will be treated by filtration through activated charcoal and/or other media as appropriate until it meets the NMOCD standards for injection into a Class 1 injection well. The injection well is operated by the Farmington office of Key Energy, their contact information is presented below.

Key Energy
5651 U. S. Highway 64
Farmington, NM 87401
Phone: (505) 327-4935

Following disposal characterization, the 1,000 gallons of cleaning solution used to clean the 3201 pipeline before hydrostatic testing will be transported off-site via DOT-approved tanker trucks for treatment and disposal by Mesa Environmental or Thermo-Fluids (see contact information under Item b.).

Item l. A brief description of the expected quality and volume of the discharge;

The hydrostatic test water will be tested in accordance with the guidelines noted in Item j. to assess if the constituent concentrations in the water meet, Subsections A, B, and C of NMAC 20.6.2.3103. Based on historical data collected from previous hydrostatic test events using similar cleaning techniques before introducing the test water, the quality of the water is expected to meet regulatory limits. The volume of the hydrostatic test water is expected to be approximately 140,500 gallons. It is intended for disposal in a Class 1 injection well.

Item m. Geological characteristics of the subsurface at the proposed discharge site;

Regional Features
The water storage location is within the north-central part of the San Juan Basin, a large asymmetric structural depression that contains Paleozoic and Mesozoic sediments up to 15,000 feet thick. The area is characterized by bedrock hillsides and mesas and Pleistocene gravel terraces of the San Juan and Animas Rivers.

Site Geology
The water storage areas are located on alluvium or the Nacimiento, Kirtland or Fruitland Formations. The alluvium in the water storage areas consists of fine to course sands, clays and varying combinations of the two. This alluvium was deposited by both fluvial and eolian action. The soils tend to be weak, compressible and moderately permeable. The thickness of alluvium ranges from less than 3 to more than 75 feet, and drapes the Nacimiento, Kirtland or Fruitland Formations (Stone, et. al., 1983).

Item n. The depth to and total dissolved solids concentration of the ground water most likely to be affected by the discharge;

Regional Hydrogeology
Three ground-water systems are present in the Tertiary and younger sedimentary deposits in this portion of the San Juan Basin.

- Confined aquifers in Tertiary sandstone units.
- Unconfined (water table) aquifers in Tertiary sandstone units near outcrop areas.
- Unconfined (water table) aquifers in the Quaternary alluvium in or near river valleys and tributaries.

Local Groundwater Hydrology. Two groundwater regimes exist near the discharge sites:

1. Unconfined aquifers in the alluvium beneath the water storage areas; and
2. Unconfined sandstone aquifers in the Paleocene Nacimiento Formation or Cretaceous Kirtland or Fruitland Formations below the alluvium (Stone, et. al., 1983).

Groundwater in the vicinity of the discharge may be as shallow as six feet below ground surface in the alluvium or as deep as deep as 235 feet in the Nacimiento Formation (Stone, et. al., 1983).

Total dissolved solids concentration (derived from specific conductance) in the shallowest water affected by the discharge is between 960 and 3,840 milligrams per liter (iWaters, 2009).

Item o. Identification of landowners at and adjacent to the discharge collection/retention site.

Landowners of the collection/retention sites:

At Blanco Plant (for the cleaning solution retention) and at MP 12 + 1500 (hydrostatic test water staging area):

El Paso Natural Gas Company
2 North Nevada Ave.
Colorado Springs, CO 80903

Landowners along the EPNG right-of-way affected by the hydrostatic testing:

George E. Hutchison
R. D. Golding
Joe O. Campbell
George A. Greenwood
George A. McColm
D. & R. G. W. Railroad
B. E. Dustin
Elbie S. Evans
United States of America (Bureau of Land Management)

Landowners within 1/3-mile of the pipeline easement:

This landowners list is provided in Appendix E and a map showing the locations of these landowners is provided in Appendix F. EPNG it will provide all affected landowners with a brief description of the work involved.

As deemed necessary by NMOCD, a public notice will be posted in accordance with Subsections A, B, and C of NMAC 20.6.2.3108 at the frac-tank staging areas (Figures 2 and 3), the Farmington, New Mexico Post Office, and published in the Farmington Daily Times newspaper. Copies of the English and Spanish versions of the public notices are presented in Appendix G. EPNG it will provide all affected landowners with a brief description of the work involved.

APPENDIX A
Material Safety Data Sheets for N-Spec 120 Cleaner

Material Safety Data Sheet

Section 1. Chemical Product and Company Identification

Common Name	**N-SPEC 120 Cleaner**
Supplier	Coastal Chemical Co., L.L.C. 3520 Veterans Memorial Drive Abbeville, LA 70510 337-893-3862
Synonym	Not available.
Trade name	Not available.
Material Uses	Not available.
Manufacturer	Coastal Chemical Co., L.L.C. 3520 Veterans Memorial Drive Abbeville, LA 70510 337-893-3862

Code	
MSDS#	Not available.
Validation Date	**9/2/2004**
Print Date	9/2/2004
Responsible Name	**Charles Toups**

In Case of Emergency Transportation Emergency Call CHEMTREC 800-424-9300
Other Infomation Call Charles Toups 337-261-0796

Section 2. Composition and Information on Ingredients

Name	CAS #	% by Weight	Exposure Limits
Confidential infomation			

Section 3. Hazards Identification

Physical State and Appearance Liquid.

Emergency Overview

CAUTION!
MAY CAUSE EYE IRRITATION.
MAY CAUSE SKIN IRRITATION.
MAY BE HARMFUL IF SWALLOWED.

Keep away from heat, sparks and flame. Avoid contact with eyes. Do not ingest. Avoid prolonged or repeated contact with skin. Keep container closed. Use only with adequate ventilation. Wash thoroughly after handling.

Routes of Entry Eye contact. Inhalation. Ingestion.

Potential Acute Health Effects

Eyes Hazardous in case of eye contact (irritant). Inflammation of the eye is characterized by redness, watering, and itching.

Skin Irritation of the product in case of skin contact: Not available.
Hazardous in case of skin contact

Inhalation Hazardous in case of inhalation.

Ingestion Hazardous in case of ingestion.

Potential Chronic Health Effects

CARCINOGENIC EFFECTS: Not available.
MUTAGENIC EFFECTS: Not available.
TERATOGENIC EFFECTS: Not available.

Medical Conditions Aggravated by Overexposure: Repeated or prolonged exposure is not known to aggravate medical condition.

Overexposure /Signs/Symptoms Not available.

See Toxicological Information (section 11)

Continued on Next Page

Section 4. First Aid Measures

Eye Contact	Check for and remove any contact lenses. Immediately flush eyes with running water for at least 15 minutes, keeping eyelids open. Cold water may be used. Get medical attention immediately.
Skin Contact	In case of contact, immediately flush skin with plenty of water for at least 15 minutes while removing contaminated clothing and shoes. Cold water may be used.Wash clothing before reuse. Thoroughly clean shoes before reuse. Get medical attention.
Inhalation	If inhaled, remove to fresh air. If not breathing, give artificial respiration. If breathing is difficult, give oxygen. Get medical attention.
Ingestion	Do NOT induce vomiting unless directed to do so by medical personnel. Never give anything by mouth to an unconscious person. If large quantities of this material are swallowed, call a physician immediately. Loosen tight clothing such as a collar, tie, belt or waistband.
Notes to Physician	Not available.

Section 5. Fire Fighting Measures

Flammability of the Product	Not available
Auto-ignition Temperature	Not available.
Flash Points	Tested - No Flash present
Flammable Limits	Not available.
Products of Combustion	These products are carbon oxides (CO, CO2), sulfur oxides (SO2, SO3...).
Fire Hazards in Presence of Various Substances	Not available.
Explosion Hazards in Presence of Various Substances	Risks of explosion of the product in presence of mechanical impact: Not available. Risks of explosion of the product in presence of static discharge: Not available.
Fire Fighting Media and Instructions	SMALL FIRE: Use DRY chemical powder. LARGE FIRE: Use alcohol foam, water spray or fog. Cool containing vessels with water jet in order to prevent pressure build-up, autoignition or explosion.
Protective Clothing (Fire)	Be sure to use an approved/certified respirator or equivalent.
Special Remarks on Fire Hazards	No additional remark.
Special Remarks on Explosion Hazards	Not available.

Section 6. Accidental Release Measures

Small Spill and Leak	The concentrated form of this material is a cleaner. During application, hazardous material on the apparatus or structure being cleaned may become part of the cleaning solution. Check with all applicable regulations before disposing of the material created during application.
Large Spill and Leak	The concentrated form of this material is a cleaner. During application, hazardous material on the apparatus or structure being cleaned may become part of the cleaning solution. Check with all applicable regulations before disposing of the material created during application.

Continued on Next Page

Section 7. Handling and Storage

Handling	Keep away from heat, sparks and flame. Keep container closed. Use only with adequate ventilation. To avoid fire or explosion, dissipate static electricity during transfer by grounding and bonding containers and equipment before transferring material. Use explosion-proof electrical (ventilating, lighting and material handling) equipment.
Storage	Keep container tightly closed and in a well-ventilated place.

Section 8. Exposure Controls/Personal Protection

Engineering Controls	Provide exhaust ventilation or other engineering controls to keep the airborne concentrations of vapors below their respective threshold limit value. Ensure that eyewash stations and safety showers are proximal to the work-station location.
Personal Protection	
Eyes	Safety glasses.
Body	Lab coat.
Respiratory	Wear appropriate respirator when ventilation is inadequate.
Hands	Impervious gloves.
Feet	Not applicable.
Personal Protection in Case of a Large Spill	Splash goggles. Full suit. Boots. Gloves. Suggested protective clothing might not be sufficient; consult a specialist BEFORE handling this product.

Product Name	Exposure Limits
Confidential infomation	

Consult local authorities for acceptable exposure limits.

Section 9. Physical and Chemical Properties

Physical State and Appearance	Liquid.
Molecular Weight	Not applicable.
Molecular Formula	Not applicable.
pH (1% Soln/Water)	6 to 8 [Neutral.]
Boiling/Condensation Point	The lowest known value is 100°C (212°F) (Water). Weighted average: 140.43°C (284.8°F)
Melting/Freezing Point	May start to solidify at 0°C (32°F) based on data for: Water. Weighted average: -46.19°C (-51.1°F)
Critical Temperature	Not available.
Specific Gravity	0.9 to 0.98 (Water = 1)
Vapor Pressure	The highest known value is 2.3 kPa (17.2 mm Hg) (at 20°C) (Water). Weighted average: 1.17 kPa (8.78 mm Hg) (at 20°C)
Vapor Density	The highest known value is 5.11 (Air = 1). Weighted average: 2.93 (Air = 1)
Volatility	Not available.
Odor Threshold	The highest known value is 34.6 ppm
Evaporation Rate	0.02 compared to Butyl acetate
VOC	Not available.

Odor	Not available.
Taste	Not available.
Color	Blue. (Dark.)

Continued on Next Page

Viscosity	Not available.
$LogK_{ow}$	The product is much more soluble in water.
Ionicity (in Water)	Anionic.
Dispersion Properties	See solubility in water, methanol, diethyl ether.
Solubility	Easily soluble in cold water, hot water, methanol, diethyl ether. Insoluble in n-octanol.
Physical Chemical Comments	Not available.

Section 10. Stability and Reactivity

Stability and Reactivity	The product is stable.
Conditions of Instability	Not available.
Incompatibility with Various Substances	Reactive with oxidizing agents, acids. Slightly reactive to reactive with reducing agents.
Hazardous Decomposition Products	Not available.
Hazardous Polymerization	Will not occur.

Section 11. Toxicological Information

Toxicity to Animals	Acute oral toxicity (LD50): 1900 mg/kg [Rat]. Acute dermal toxicity (LD50): 9510 mg/kg [Rabbit].
Chronic Effects on Humans	No additional remark.
Other Toxic Effects on Humans	Hazardous in case of eye contact (irritant), of ingestion, of inhalation. Hazardous in case of skin contact (irritant). Slightly hazardous in case of skin contact (sensitizer).
Special Remarks on Toxicity to Animals	Not available.
Special Remarks on Chronic Effects on Humans	Not available.
Special Remarks on Other Toxic Effects on Humans	Material is irritating to mucous membranes and upper respiratory tract.

Section 12. Ecological Information

Ecotoxicity	Not available.
BOD5 and COD	Not available.
Biodegradable/OECD	Not available.
Mobility	Not available.
	These products are carbon oxides (CO, CO_2) and water, nitrogen oxides (NO, NO_2...), sulfur oxides (SO_2, SO_3...), phosphates. Some metallic oxides.
Toxicity of the Products of Biodegradation	The products of degradation are less toxic than the product itself.

Continued on Next Page

Special Remarks on the Products of Biodegradation	Not available.

Section 13. Disposal Considerations

Waste Information	Waste must be disposed of in accordance with federal, state and local environmental control regulations.
Waste Stream	Not available.

Consult your local or regional authorities.

Section 14. Transport Information

Shipping Description	Not a DOT controlled material (United States).
	Not regulated.
Reportable Quantity	11061.8 lbs. (5016.7 kg)
Marine Pollutant	Not regulated - Alkylaryl sulfonate amine salt - less then 10 % .
Special Provisions for Transport	Contains alkylbenzenesulfonate

Section 15. Regulatory Information

HCS Classification	CLASS: Target organ effects.
U.S. Federal Regulations	TSCA 8(a) PAIR: contains Alkylbenzenesulfonate SARA 302/304/311/312 extremely hazardous substances: No products were found. SARA 302/304 emergency planning and notification: No products were found. SARA 302/304/311/312 hazardous chemicals: No products were found. SARA 311/312 MSDS distribution - chemical inventory - hazard identification: No products were found. SARA 313 toxic chemical notification and release reporting: No products were found. Clean Water Act (CWA) 307: No products were found. Clean Water Act (CWA) 311: No products were found. Clean air act (CAA) 112 accidental release prevention: No products were found. Clean air act (CAA) 112 regulated flammable substances: No products were found. Clean air act (CAA) 112 regulated toxic substances: No products were found.
International Regulations	
EINECS	Not available.
DSCL (EEC)	Risk to eyes. May cause irriationby skin contact. R322- May be harmful if swallowed. R36/38- Irritating to eyes and skin.
International Lists	No products were found.
State Regulations	Pennsylvania RTK: Dipropylene glycol monomethyl ether; Trade Secret; Gylcol Ether PNB Florida: Dipropylene glycol monomethyl ether; Ethanol Minnesota: Dipropylene glycol monomethyl ether Massachusetts RTK: Dipropylene glycol monomethyl ether; Ethanol New Jersey: Ethanol; Gylcol Ether PNB **WARNING:** This product contains the following ingredients for which the State of California has found to cause birth defects which would require a warning under the statute: Ethanol

Continued on Next Page

Section 16. Other Information

Label Requirements

MAY CAUSE EYE IRRITATION.

APPENDIX B
Certification of Siting Criteria

1 Certification of Siting Criteria

Hydrostatic Testing of Line 3201

I, Michael Lee McCown, have performed a site visit to look for the presence of the items listed below. Some were observed within the specified distance for each item listed below from the edge of the pipeline right of way to site where the water storage tanks will be located at mile post 12 + 1500 on Line 3201 in San Juan County, NM. The hydro-test water will also be introduced to the pipeline at this site. A note beside each item below describes my observations.

i. Within 200 feet of a watercourse, lakebed, sinkhole, or playa lake; *NOTE: The actual Animas River is further than this distance.*

ii. Within 1,000 feet of an existing wellhead protection area or 100-year floodplain; *NOTE : I will defer to the statement and research from our consultant, Kleinfelder. This information is included as part of the NOI.*

iii. Within, or within 500 feet of, a wetland; *NOTE: Yes, the Animas River's green belt will be within this distance.*

iv. Within the area overlying a subsurface mine; *NOTE: No.*

v. Within 500 feet from the nearest permanent residence, school, hospital, institution or church. *NOTE: Yes within approximately150 feet.*

On behalf of El Paso Natural Gas, I state that the above information is complete and true to the best of my knowledge.

Marco Wikstrom - RE: Abandoned Mines in Farmington

From: "Tompson, Mike, EMNRD" <Mike.Tompson@state.nm.us>
To: "Marco Wikstrom" <MWikstrom@kleinfelder.com>
Date: 12/30/2009 10:13 AM
Subject: RE: Abandoned Mines in Farmington

Marco,

I have no record on any abandoned mines in the three sections you mentioned. But just a reminder that there are many abandoned mines out there that we don't know about.

Hope this helps.

Mike Tompson
New Mexico Abandoned Mine Land Program
(505) 476-3427

To: Tompson, Mike, EMNRD
Subject: Abandoned Mines in Farmington

Mike,

We're doing another hydrostatic test in the Farmington area and need to know if there are any known abandoned mines in the following areas:

S-1, T-29N, R-13W

S-6, T-29N, R-12W

S-14, T-29N, R-11W

Thanks,
Marco

APPENDIX G
Public Notice Text in Spanish and English

AVISO PÚBLICO

El Ministerio de Transporte de Estados Unidos (USDOT) requiere pruebas de presión periódicas en todas las tuberías reguladas por el USDOT-reguladas. La compañía de El Paso Natural Gas (EPNG) da por este medio el aviso que el uso siguiente del permiso de la descarga se ha sometido a la división de la conservación de aceite del Nuevo México (NMOCD) de acuerdo con la subdivisión B, C, E, y F del código administrativo de 20.6.2.31 08 Nuevo México. La dirección local del correo de EPNG es: El Paso Natural Gas, San Juan Area Office, P.O. Box 127, Bloomfield, NM 87413.

El Paso Natural Gas ha presentado una solicitud para conductor una hidrostática del agua de la tuberia 3201 de la prueba que ocurrirá en la servidumbre de EPNG en sección 1 del municipio 29 del norte, se extiende 13 del oeste, y las secciones 6, 7, 8 del municipio 29 del norte, se extiende 12 del oeste, en el condado de San Juan, Nuevo México. El propósito de hidrostático (prueba con agua) es para determinar el grado a los defectos potenciales pudieron amenazar a la capacidad de la tubería de sostener la presión máxima permitida de la operación. La prueba implica el purgar del gas natural de la tubería, limpiando la tubería con un quitamanchas acuoso, no-peligroso, rellenar la tubería con agua, después presurizando la tubería a una presión más alta que la presión de funcionamiento estándar para una duración especificada del tiempo.

Una porción de la tubería de EPNG 3201 hidrostático será probada. Antes de la prueba hidrostática, la tubería será limpiada usando aproximadamente 1.000 galones de un quitamanchas acuoso y no-peligroso, N-Spec. 120. El volumen de solución de la limpieza se estima para ser 1.000 galones y será almacenado en dos estaciones del compresor de EPNG; Estación del compresor de Blanco. La estación del compresor de Blanco está situada en el N/2 del N/2, sección 14, el municipio 29 del norte, se extiende 13. Una muestra compuesta de la solución de la limpieza será analizada para la corrosividad, el encienda, la reactividad, y la toxicidad además de los estándares de la Comisión del control de calidad del agua del nanómetro (WQCC) descritos más abajo. La solución de la limpieza puede almacenar en el frac-tanque por dos semanas con una opción por dos semanas adicionales de almacenaje. Esta agua será transportada para la disposición apropiada al Mesa ambiental en Belen, Nuevo México o Thermo Fluids, Inc. en Albuquerque, Nuevo México.

Hasta 140.500 galones de agua inusitada fresca, de la ciudad de las utilidades de Farmington, serán almacenados inicialmente en los tanques de 21.000 galones (los frac-tanques) situados en el SW/4 del sección 1, el municipio 29 del norte, se extiende 13 del oeste en la proporidad de EPNG, approximente 700 pies suroeste de la interseccion de Gila Calle y Camino de Engles. Después de la prueba hidrostática, las mangueras y/o las pipas flexibles serán utilizadas para transferir la agua usada de la prueba en los tanques del frac situados en las estaciones del compresor de Río Vista. Tanto como los 7 tanques del frac pueden ser necesarios para contener temporalmente hasta 140.500 galones de agua usada de la prueba. Esta agua será analizada para asegurarse que cumplio los estándares de secciones A, B, y C de WQCC según 20.6.2.31 03. De la prueba se puede almacenar en los tanques del frac por dos semanas con una opción por dos semanas adicionales de almacenaje, hasta que finalicen resultados analíticos. El agua hidrostática de la prueba no será descargada. Después del recibo de la aprobación de NMOCD, será transportada e inyectada correctamente en un pozo de inyección permitido de la clase 1 funcionado por Key Energy de Farmington, Nuevo México.

La agua subterránea más baja probablemente que se afectará por un escape, una descarga accidental, o un derramamiento existe en una profundidad de 6 pies debajo de la superficie de tierra. Esta sistema del acuífero tiene una concentración total de los sólidos en suspensión entre de aproximadamente 960 y 3.840 miligramos por litro o mayor (calculado de conductancia específica divulgada entre de 1.500 y 6.000 µS/cm).

El aviso del intento esquemas cómo el agua y la basura producidas serán manejadas correctamente, incluyendo la dirección, almacenaje, y la disposición final. El aviso del intento también incluye los procedimientos para la gerencia apropiada de escapes, de descargas accidentales, y de derramamientos para proteger las aguas del estado de Nuevo México.

Para la información adicional, para ser colocado en una lista de personas a quienes se mandan propaganda facilidad-específica para los avisos futuros, o someter los comentarios satisfacen entran en contacto con:

Brad Jones, ingeniero ambiental
New Mexico Energy, Minerals and Natural Resources Department
Oil Conservation Division
1220 South St. Francis Drive
Santa Fe, NM 87505
Teléfono: (505) 476-3487

La energía del nanómetro y el Deprtamento de los Recursos Naturales y Minerales aceptarán comentarios y declaraciones del interés con respecto a esta prueba hidrostática y proporcionarán los avisos futuros para esta tubería a petición.

PUBLIC NOTICE

The United States Department of Transportation (USDOT) requires periodic pressurized tests on all USDOT-regulated pipelines. El Paso Natural Gas Company (EPNG) hereby gives notice that the following discharge permit application has been submitted to the NM Oil Conservation Division (NMOCD) in accordance with Subsection A, B, D and F of 20.6.2.3108 of New Mexico Administrative Code (NMAC). The local EPNG mailing address is: El Paso Natural Gas, San Juan Area Office, P.O. Box 127, Bloomfield, NM 87413.

EPNG has submitted an application to perform a hydrostatic test of the 3201 Pipeline on the EPNG pipeline easement in Section 1, Township 29 North, Range 13 West, and Sections 6, 7, and 8 of Township 29 North, Range 12 West, in San Juan County, New Mexico. The purpose of hydrostatic (testing with water) is to determine the extent to which potential defects might threaten the pipeline's ability to sustain maximum allowable operation pressure. The test involves purging the natural gas from the pipeline, cleaning the pipeline with an aqueous, non-hazardous cleaning fluid, filling the pipeline with water, then pressurizing the pipeline to a pressure higher than the standard operating pressure for a specified duration of time.

A portion of the EPNG 3201 pipeline will be hydrostatically tested. Prior to hydrostatic testing, the pipeline will be cleansed using approximately 1,000 gallons of an aqueous and non-hazardous cleaning fluid, N-Spec 120. The volume of cleaning solution is estimated to be 1,000 gallons and it will be stored at EPNG's Blanco compressor station located in the N/2 of the N/2, Section 14, Township 29 North, Range 11 West. A composite sample of the cleaning solution will be analyzed for corrosivity, ignitability, reactivity, and toxicity for disposal characterization. The water/cleaning solution mixture may be stored in the frac-tanks for two weeks with the option to store it for an additional two weeks. This water will be transported for proper disposal to the Mesa Environmental regional processing facility in Belen, NM or Thermo Fluids, Inc. in Albuquerque, NM.

Up to 140,500 gallons of fresh unused water, from City of Farmington, will be initially stored in as many as seven 21,000-gallon tanks (frac-tanks) located in the SW/4 of Section 1, Township 29 North, Range 13 West within EPNG's property approximately 700 feet southwest of the intersection of Gila Street and English Road within the City of Farmington. Following hydrostatic testing, hoses and/or flexible pipes will be used to transfer the used test water into the frac-tanks. A composite sample of this water will be analyzed to ensure it meets the WQCC standards as per Subsections A, B, and C of NMAC 20.6.2.3103. Used test water may be stored in the frac-tanks for two weeks with the option to store it for an additional two weeks. The hydrostatic test water will not be discharged. After receipt of NMOCD approval, it will be properly transported and injected into a permitted Class 1 injection well operated by Key Energy of Farmington, NM.

The shallowest groundwater likely to be affected by a leak, accidental discharge, or spill exists at a depth of 6 feet below the ground surface. This aquifer system has a total dissolved solids concentration of between approximately 960 and 3,840 milligrams per liter or greater (calculated from reported specific conductance of between 1,500 and 6,000 µS/cm).

The notice of intent outlines how produced water and waste will be properly managed, including handling, storage, and final disposition. The plan also includes procedures for the proper management of leaks, accidental discharges, and spills to protect the waters of the State of New Mexico.

For additional information, to be placed on a facility-specific mailing list for future notices, or to submit comments please contact:

Brad Jones, Environmental Engineer
New Mexico Energy, Minerals and Natural Resources Department
Oil Conservation Division
1220 South St. Francis Drive
Santa Fe, NM 87505
Phone: (505) 476-3487

The NM Energy, Minerals and Natural Resources Department will accept comments and statements of interest regarding this hydrostatic test and will provide future notices for this pipeline upon request.
