Re: 2009 Annual Groundwater Monitoring Report
Targa Midstream Services, L.P., Monument Gas Plant (GW-025)
Lea County, New Mexico

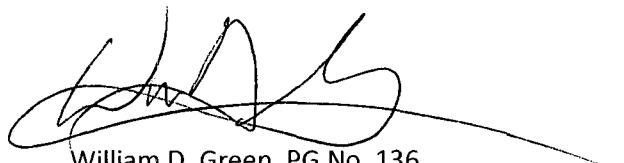

Dear Mr. Von Gonten:

The enclosed report is submitted to the New Mexico Oil Conservation Division on behalf of Targa Midstream Services, L. P. (Targa) to present the results of groundwater monitoring performed at the Monument Gas Plant for the 2009 calendar year.

If you have any questions or concerns, please call me at 432.687.0901 to discuss.

Sincerely,

LARSON & ASSOCIATES, INC.

A handwritten signature in black ink, appearing to read 'William D. Green'. The signature is fluid and cursive, with a large, stylized 'W' at the beginning.

1.0 Executive Summary

This report presents the 2009 investigation activities and groundwater monitoring results for the Targa Midstream Services, L.P. (Targa) Monument Gas Plant (Facility) located about 2.6 miles southeast of Monument, New Mexico, in unit N (SE/4, SW/4), Section 36, Township 19 South, Range 36 East, Lea County, New Mexico (Site or Property, Figure 1). The Facility operates under New Mexico Oil Conservation Division (OCD) discharge permit GW-025.

The following groundwater monitoring and investigation activities were conducted during the past year:

- Groundwater Gauging and Sampling Event on April 13 and 14, 2009
- Groundwater Gauging and Sampling Event on October 27 and 28, 2009
- Monitor wells WP-21, WP-22, and WP-23 installed to delineate the lateral and downgradient extent of hydrocarbon contaminated groundwater

The following observations are documented in this report:

- Groundwater flow direction remains bifurcating to the southeast and the south at variable gradient from north to south
- WP-02 remained dry, as it has since September 20, 2007
- Product was detected in WP-15 and WP-18 during both sampling events
- Benzene and chloride remain contaminants of concern in groundwater
- Barium concentrations in groundwater appear to be a disassociation byproduct that is naturally occurring within the soil

Since the removal of free-phase hydrocarbon and the dissolved phase hydrocarbon plume has been delineated, Targa requests approval for annual (one yearly) monitoring for BTEX, general water chemistry, and gauging for plant records, and inclusion in Groundwater Discharge Permit renewals. Targa will notify the OCD at least 48 hours prior to the annual monitoring events, and as soon as possible to any significant change in analyte concentrations.

2.0 Investigation Chronology

The following events have been documented in connection with the GW-025 investigation.

c. 1935	The Gas Plant is constructed by Natural Gasoline Corporation, a subsidiary of Warren Petroleum.
January 26, 1936	Gas Plant started up for Amerada Petroleum Corporation, later sold back to Warren Petroleum.
1946	El Paso Corporation constructs compressor station southeast of Gas Plant.
April 1962	Climax Chemical Company (Climax) begins operations north-northwest of the Gas Plant. Climax produces hydrochloric acid (HCl), sulfuric acid, and sodium sulfate. Site chosen for nearby salt deposits. HCl stored in unlined surface impoundments. UST onsite, but closed prior to registration requirements.
c. 1976 - 1977	Gas plant upgraded to Cryo, Amine system, and SRU.
Prior to 1982	Climax plugs and abandons brine wells where previously fresh water was pumped down to evaporites between 2,420 and 2,616 feet bgs to dissolve and return to the surface (Preliminary Review Report, Climax Chemical, 1987).
1982	Justification for No Discharge Plan And Alternative Application for Discharge Plan

December 14, 2009

Prior to 1983	submitted to State of New Mexico by Climax. A produced condensate release occurs at the Monument Gas Plant (no date, volume or location in records).
June 15, 1987	Preliminary Review Report, Climax Chemical Company issued for RCRA Facility Assessment. EPA analyses from discharge pipe to HCl surface impoundment indicates 15,500 – 17,300 ppm chloride, and 15,100 – 19,000 ppm sulfate at a pH 3.3.
Prior to 1989	Hydrocarbons found in Climax wells (1-2 miles south of facility).
March 29, 1989	OCD representatives Mr. David Boyer and Mr. Roger Anderson inspect Monument Gas Plant's new brine pond liner. "While inspecting the brine pond they noticed the Climax Chemical plant discharging salt water into an open area. Some of this water had broken through a dam (Warren) had built along our property fence and was leaking onto (Warren) property... In addition they asked about the oil processing company located to the south of our plant saying they did not have any record of them." (March 30, 1989 Warren Memorandum)
March 30, 1989	Condensate recovery commences at Monument Gas Plant in monitor wells WP-01, WP-02, WP-03 and Climax 5-9.
August 4, 1989	Warren Petroleum submits to OCD map of monitor wells and pumping records – to date 5.8 gallons condensate recovered at an average of 300 – 500 milliliters every 4 – 6 days.
October 6, 1989	Warren Petroleum submits to OCD map of monitor wells and pumping records – to date 2,054.3 gallons condensate recovered.
December 18, 1989	Warren Petroleum submits to OCD map of monitor wells and pumping records – to date 8,643.5 gallons condensate recovered at an average of 110 gallons per day.
August 6, 1990	Warren Petroleum submits to OCD map of monitor wells and pumping records – to date 18,088.5 gallons condensate recovered at an average of 42 gallons per day.
August 16, 1991	State of New Mexico Hazardous and Radioactive Materials Bureau (HRMB) sent letter to Mr. Jimmy T. Cooper, landowner, notifying him of Climax's request for Alternative Concentration Limits (ACL). Justifications include, "Immediately adjacent to and downgradient of Climax Chemical is the Warren Petroleum Company (Chevron) refinery. The upper-most aquifer beneath the refinery has been significantly impacted by hydrocarbon contamination. Due to past oil-field brine contamination of this same aquifer the Oil Conservation Division (OCD) of New Mexico Energy Minerals and Natural Resources Department is only requiring the refinery to recover hydrocarbon product floating on top of the groundwater within the aquifer."
October 2, 1991	Warren Petroleum submits to OCD map of monitor wells and pumping records – to date 26,348.5 gallons condensate recovered at an average of 20 gallons per day.
October 30, 1991	PIANO analysis conducted by Southern Petroleum Laboratories, Inc. (SPL) on samples from Waste Oil, Condensate, and groundwater wells. Groundwater sample has a Pristane (first peak after C17) to Phytane (first peak after C18) ratio of 1.492; Waste Oil has 1.071; Condensate has neither Pristane nor Phytane.
March 11, 1992	Climax files bankruptcy. Disposal Well DP-298 permit modified to accept HCl

December 14, 2009

	injected into a San Andres limestone for neutralization. Also evaluated as a Salt Water Disposal well. (Currently in operation 4/2009)
July 6, 1994	OCD requests Warren Petroleum to submit a workplan to complete the definition of the extent of groundwater contamination.
October 31, 1994	Warren Petroleum submits workplan to OCD to include the installation of soil borings and monitor wells.
February 22 – 24, 1995	Four soil borings (SB-3 to SB-7) and seven monitor wells (WP-04 to WP-10) installed.
March 28, 1995	HRMB notification letter to Warren Petroleum of "...at least 2 feet of oil product floating on top of the groundwater..." in well #12-9. (This well is upgradient from the Monument Plant) Letter further requests Warren to determine if a pipeline from the Monument Greyburg-San Andres Field had a leak prior to 1991.
April 21, 1995	Geraghty & Miller submits Liquid Hydrocarbon Assessment for Warren Petroleum review. Major report findings are: impacted shallow groundwater is not a viable water resource; groundwater quality upgradient and around the plant is not suitable for drinking water, livestock or irrigation use; the horizontal and vertical extent of the impacted area is defined; and the sources of contamination are not limited to the Gas Plant, but also include upgradient sources.
May 2, 1995	Warren Petroleum submits Liquid Hydrocarbon Assessment to OCD.
June 20, 1995	OCD requests: additional groundwater delineation; installing and operating a product recovery system in WP-2, WP-3, and WP-10; and quarterly monitoring.
August 31, 1995	Warren Petroleum submits response to OCD proposing: a monitor well adjacent to the Climax well; an additional monitor well east of WP-10; and additional wells to the east of WP-10 as needed.
September 26, 1995	OCD approves August 31st workplan.
Prior to October 31, 1995	WP-08 and WP-09 converted to cathodic protection Wells.
November 8 – 9, 1995	Geraghty & Miller install WP-11 through WP-15 (data reported in February 29, 1996 report).
June 14, 1996	Warren Petroleum submits to the OCD groundwater elevation and product thickness maps for July – December 1995, and request change from semi-annual to annual reporting.
August 9, 1996	OCD grants request to change to annual reporting.
February 14, 1997	Geraghty & Miller submits Annual Summary Report for 1996 Groundwater Monitoring Activities for OCD review. Groundwater is reportedly bifurcating towards the southeast and the south, with a static head drop of approximately 0.5 feet across the site. Hydrocarbon recovery system expansion to include WP-11 and WP-13 recommended.
March 25, 1997	OCD responds to February 14th report and approves recommendations.
April 1997	Hydrocarbon recovery operations ceased due to low water table conditions and pump limitations.
March 10, 1998	ARCADIS Geraghty & Miller submits Annual Summary Report for 1997 Groundwater Monitoring Activities for OCD review. Groundwater is reportedly bifurcating towards the southeast and the south. Decreased monitoring frequency requested.

December 14, 2009

June 22, 1998	OCD approves changing monitoring frequency from quarterly to semiannually.
February 17, 2000	ARCADIS Geraghty & Miller submits Annual Report for 1999 Groundwater Monitoring Activities for OCD review. Groundwater is reportedly bifurcating towards the southeast and the south.
April 20, 2001	ARCADIS Geraghty & Miller submits Annual Report for 2000 Groundwater Monitoring Activities for OCD review.
July 25, 2001	LAI on behalf of Dynegy submits Groundwater Discharge Plan GW-025 to OCD.
January 9, 2002	ARCADIS Geraghty & Miller submits Annual Report for 2001 Groundwater Monitoring Activities for OCD review. Groundwater is reportedly bifurcating towards the southeast and the east.
January 17, 2002	OCD approves the Groundwater Discharge Plan with conditions.
February 11, 2003	LAI submits Subsurface Investigation Report to OCD.
March 6, 2003	OCD acknowledges receipt of the Subsurface Investigation Report and requests additional monitor wells to the east, south and west of the plant.
March 18, 2003	LAI submits to the OCD on behalf of Dynegy, 2002 Annual Groundwater Monitoring Report.
April 24, 2003	OCD requests a workplan for "additional downgradient and lateral controls on the extent of hydrocarbon contamination of groundwater."
June 27, 2003	Workplan submitted to OCD for groundwater investigations at the Monument Gas Plant plume.
September 10, 2003	OCD approves Monument Gas Plant groundwater investigation.
October 7, 2003	LAI submits to Dynegy a summary of gas chromatography fingerprint analyses for PSH from WP-04, WP-06, and WP-15 (6/10/2003 data); a summary of PSH thicknesses for WP-04 and WP-15 during 2002-2003; groundwater analyses summary; maps of PSH thickness; and bar graphs of hydrocarbon thickness measurements.
November 14, 2003	Dynegy submits to the OCD Workplan for Monitoring Well Installation at Monument Gas Plant.
January 4, 2004	LAI submits to the OCD the results of North (#2) Brine Pond subsurface closure investigation. Three hand auger borings to 7 feet bgs and three soil borings to 30 feet bgs installed.
March 18, 2004	LAI submits 2003 Annual Groundwater Monitoring Report for OCD review.
May 15, 2005	LAI submits 2004 Annual Groundwater Monitoring Report for OCD review.
May 18, 2005	Email from OCD requesting additional monitor wells downgradient of WP-04, and WP-12 & WP-14.
August 4, 2005	LAI installs WP-16, WP-17, and WP-18 in the downgradient direction. WP-17 and WP-18 exceed WQCC values for benzene.
November 1, 2005	LAI submits Free Product Investigation Report to OCD documenting the installation of WP-04R, WP-16, WP-17, and WP-18.
February 25, 2006	LAI submits 2005 Annual Groundwater Monitoring Report for OCD review. Continued quarterly groundwater monitoring recommended.
March 3, 2006	LAI submits to the OCD the Brine Pond #1 closure plan.
July 17, 2007	LAI submits 2006 Annual Report, Monument Plant Ground Water Monitoring for OCD review.
September 29, 2008	LAI submits 2007 Groundwater Monitoring Report for OCD review.
September 30, 2008	LAI installs five soil borings in the (#1) South Brine Pond as part of closure

December 14, 2009

	investigation.
October 21, 2008	OCD approves closure plan for (#2) North Brine Pond.
December 29, 2008	LAI installs monitor wells WP-19 and WP-20 upgradient and downgradient of the (#2) North Brine Pond, respectively, and adjacent to – and downgradient of – the Climax facility. Chloride in groundwater is 17,700 mg/l and 7,780 mg/l, respectively.
May 26 – 27, 2009	WP-21, WP-22, and WP-23 installed and achieves lateral and downgradient hydrocarbon plume delineation.
July 16, 2009	North (#2) Brine Pond Closure Report submitted to OCD.
July 17, 2009	South (#1) Brine Pond Investigation Report submitted to OCD.

3.0 Vicinity Characteristics

3.1 Topography

The elevation of the Site is approximately 3,575 feet above mean sea level as shown on the Monument South, New Mexico (1985) USGS 7.5-Minute Quadrangle Map. The topographic region is the relatively flat *Laguna Valley* section of the *Querecho Plains*. The facility vicinity slopes gently to the southeast. A current topographic map is included as Figure 1.

3.2 Geology

The *Geologic Map of New Mexico* (2003) provides a basic surficial geology. This source indicates the vicinity's surface geology is comprised of Holocene to mid-Pleistocene age piedmont alluvial deposits. The description indicates this material includes deposits of higher gradient tributaries bordering major stream valleys, alluvial veneers of the piedmont slope, and alluvial fans. Locally it may include the uppermost Pliocene deposits.

Subsurface conditions at the site primarily consist of Ogallala Formation unconformably overlying Chinle redbeds. Following deposition of the Ogallala, a prolonged period of erosion reworked the fringe areas of the Ogallala creating the Mescalero Ridge, north of the facility. The reworked Ogallala deposits form the bulk of the alluvial material that has accumulated in the Laguna Valley (Nicholson and Clebsch, 1961, p. 9). The site is located on the edge of the Laguna Valley where a relatively thin sequence of alluvial material is present at the surface.

Monitor well boring logs indicate a general lithology of a two- to 12-foot thick layer of unconsolidated sand over an 18- to 35-foot thickness of carbonate-indurated sand (caliche). Beneath the caliche layer is a clayey sand or red-bed clay. The geology encountered in the monitor wells is interpreted from the top-down to be a thin sequence of Holocene to Pleistocene aged eolian and alluvial sands deposited unconformably on a sequence of Miocene-Pliocene age Ogallala Formation alluvial sands. Much of the remaining Ogallala sequence is now calcified. This caliche layer most likely represents an *in situ* carbonate inter-granular deposition at the funicular vadose zone from continued deflation of the groundwater surface as erosion deepened the ancestral stream channels, and/or deposition in the pendular vadose zone by the down-driving of carbonates by precipitation, leaving a residual during dry period evaporation.

December 14, 2009

Groundwater occurs only in the bottom portion of the Ogallala in the vicinity of the Monument Gas Plant. The Ogallala Formation is also unconformably deposited on Triassic-aged Chinle redbeds. To collect adequate groundwater in monitor wells to determine static potentiometric surface elevation, most of the wells are completed with a sump extending into the Chinle Formation.

3.3 Surface Water Occurrence

Throughout much of the United States the hydraulic divisions of surface water recharge zones affect, or are affected by the movement of groundwater. However, in the desert southwest surface water often is disassociated with the movement of groundwater. This scenario is consistent with conditions found in the vicinity of the facility. There are no streams, springs, or ponds on the facility, or within two miles of the facility. The nearest surface water is the ephemeral "South" Monument Draw south of the facility, Monument Springs north of the facility, and the ephemeral "North" Monument Draw east of the facility.

Springs act as natural discharge points of groundwater from the Ogallala deposits along the contact of the permeable Ogallala and the impermeable Chinle redbeds below. Monument Springs discharges groundwater from the Ogallala-Chinle contact in Section 26, T. 19 S., R. 36 E, about two miles north of the site.

There are two Monument Draws within Lea County; both watersheds have headwaters in Lea County, west of Hobbs. Both watersheds have the same name, without a "North" or "South" discriminator. The "North" Monument Draw flows southeastward to the south of Seminole, Texas, where it combines with Seminole Draw to form Mustang Draw. Mustang Draw is an ephemeral stream, which ends at its confluence with the Colorado River.

The "South" Monument Draw flows southeastward to the east of Eunice, New Mexico, then south toward the Pecos River near Pyote, Texas. Neither watersheds have continuous flow, with the "South" draw feeders particularly broken by anastomosation and karstic playa lake sinks, however, extreme regional storm events may produce enough runoff volume to cause these discontinuous segments to act a single watershed.

3.4 Groundwater Occurrence

Regional direction for groundwater flow is towards the southeast, with variations occurring near pumping stresses and subsurface features. The *Office of the State Engineer Southeast New Mexico Water Level Data* does not identify any water wells within the Section. Water levels observed at the facility have varied between 21.11 (WP-01, December 27, 2004) and 42.90 (WP-14, March, 18, 2004) feet below ground surface (bgs) during the life of this investigation. The Nicholson and Clebsch-produced groundwater map indicates a ridge in the redbeds that bisect the facility from the north to south. This basal ridge splits groundwater into two lobes – a west lobe moving to the south, and an east lobe moving to the southeast. This ridge was described as a "nose" by Geohydrology Associates, Inc. in the circa 1982 *Justification for No Discharge Plan and Alternative Application for Discharge Plan* (page 15).

Other information of interest gleaned from the Geohydrology report includes widespread historic chloride contamination in groundwater reported prior 1955, and the occurrence of "oil stain on water" or "strong odor" reported in four diverse locations in 1961 and 1981.

December 14, 2009

4.0 Monitoring Results

During the two semi-annual groundwater monitoring events, all monitor wells associated with this investigation were gauged and sampled as conditions allowed. WP-02 remained dry, as it has since September 20, 2007. Two monitor wells were installed upgradient from the facility on December 29, 2008 as part of the North (#2) Brine Pond investigation further discussed in Section 5.1. The East Lobe hydrocarbon plume delineation is discussed in Section 5.2.

All monitoring data has been mapped using Surfer® version 8 surface contouring and mapping software. Data was reduced using the Kriging geostatistical gridding methodology. Kriging uses a linear least squares estimation algorithm that attempts to model trends suggested by the data.

4.1 Site-Specific Groundwater Hydrology

Groundwater gradient appeared variable during both events. Surfer® groundwater plots depict a relative flatness in the upgradient direction, with steeper slopes into two lobes, with a dividing channel-like feature trending south exhibiting the steepest gradient. Based on these features the evaluation for each event is sub-divided into the observations of the east and west lobes. The east lobe is defined as monitor wells WP-10, WP-11, WP-12, WP-13, WP-14, WP-15, WP-16, WP-17, WP-18, and the newly installed WP-21, WP-22, and 23. The west lobe is defined as monitor wells WP-01, WP-02, WP-04, WP-04R, WP-05, WP-06, WP-07, WP-19, and WP-20. Table 1 presents a summary of the depth to groundwater measurements.

4.1.1 April 2009 Event

During April 2009, the groundwater potentiometric surface for the east lobe stood between 3,553.60 feet in the upgradient direction (WP-10) declining to 3,539.80 feet in WP-16. LNAPL was observed in WP-15 (0.05 feet) and WP-18 (0.03 feet).

The potentiometric surface of the west lobe stood between 3,556.63 feet in the upgradient WP-06, decreasing in elevation to 3,540.27 feet in WP-04. LNAPL was not observed in this groundwater lobe during this event.

Figure 3a is a Surfer®-generated plot of the observed groundwater gradient for the April 2009 monitoring event.

4.1.2 October 2009 Event

In October 2009, the groundwater potentiometric surface for the east lobe stood between 3,553.58 feet in the upgradient direction (WP-10) declining to 3,534.61 feet in the downgradient direction (WP-23). LNAPL was detected in WP-15 (0.03 feet), and WP-18 (0.02 feet).

The potentiometric surface of the west lobe stood between 3,556.63 feet in the upgradient WP-06, decreasing in elevation to 3,540.29 feet in WP-04. LNAPL was not observed in this groundwater lobe during this event.

Figure 3b is a Surfer®-generated plot of the observed groundwater gradient for the October 2009 monitoring event.

December 14, 2009

4.2 Groundwater Chemistry

Groundwater samples were collected from monitor wells after approximately three casing volumes of groundwater were removed from each well and the wells had sufficiently recovered. Purging and sampling was accomplished with either a stainless steel environmental pump with backflow preventer and polyethylene tubing, or for lower-volume wells, using dedicated disposable polyethylene bailers. Purge pumps were cleaned internally and externally with Alconox® and flushed with commercially available distilled water before the event and between wells.

Sample aliquots were collected in laboratory prepared containers, individually labeled, and placed into an ice-chilled chest. Lone Star Overnight courier services delivered the samples under custody seal and chain-of-custody control to DHL Analytical, Inc. (DHL), a National Environmental Laboratory Accreditation Program (NELAP) accredited laboratory in Round Rock, Texas. All samples were received intact and below the NELAP-required temperature parameter.

DHL was contracted to analyze the samples for benzene, toluene, ethylbenzene, and total xylenes (BTEX), dissolved metals (arsenic, barium, cadmium, chromium, lead, mercury, selenium, silver, calcium, magnesium, potassium and sodium), anions (chloride, sulfate) and water quality parameters alkalinity, and total dissolved solids (TDS). Duplicate samples for a quality control (QC) check were submitted as blind samples to DHL. The duplicate samples were collected from WP-07 and WP-13 during the Spring and Fall events, respectively. Laboratory analytical results are discussed in the following sections. Appendix B contains a CD-ROM of the laboratory analytical reports.

4.2.1 BTEX Analytical Results

Samples for the BTEX petroleum-compounds were submitted for analyses using EPA SW846 method 8021B. Benzene concentrations observed during the life of this investigation indicate there are no clear increasing or decreasing trends. All benzene values represent dissolved-phase concentrations that are well below the benzene solubility limit of 1,770 mg/l. Table 2 presents a cumulative summary of the BTEX analyses.

April 2009 Benzene Results

Analytical data indicates the following samples exhibited benzene concentrations in excess of the 0.01 milligrams per liter (parts per million, mg/l) WQCC human health standard in the following samples from the east lobe:

- WP-10 (3.54 mg/l)
- WP-11 (4.91 mg/l)
- WP-12 (1.81 mg/l)
- WP-13 (0.219 mg/l)
- WP-14 (0.414 mg/l)
- WP-15 (0.575 mg/l)
- WP-17 (3.75 mg/l)
- WP-18 (0.380 mg/l)

Analytical data indicates the following samples exhibited benzene concentrations in excess of the 0.01 mg/l WQCC human health standard in the following samples from the west lobe:

- WP-01 (0.151 mg/l)
- WP-04R (0.01090 mg/l)

A comparison of the primary (WP-07, <0.0008 mg/l) and duplicate (<0.0008 mg/l) samples indicate no deviation. No data quality exceptions were noted in the DHL case narratives. Figure 5a is a Surfer®-generated plot of the observed benzene concentration for the April 2009 monitoring event.

December 14, 2009

October 2009 Benzene Results

Analytical data indicates the following samples exhibited benzene concentrations in excess of the 0.01 mg/l WQCC human health standard in the following samples from the east lobe:

- WP-10 (3.73 mg/l)
- WP-11 (5.21 mg/l)
- WP-12 (1.79 mg/l)
- WP-13 (0.168 mg/l)
- WP-14 (0.220 mg/l)

Analytical data indicates the following samples exhibited benzene concentrations in excess of the 0.01 mg/l WQCC human health standard in the following samples from the west lobe:

- WP-01 (0.186 mg/l)
- WP-04R (0.01710 mg/l)
- WP-05 (0.309 mg/l)
- WP-06 (0.0384 mg/l)

A comparison of the primary (WP-13, 0.168 mg/l) and duplicate (0.143 mg/l) samples indicate a 12.3% sample variance, which is within data acceptance criteria. No data quality exceptions were noted in the DHL case narratives. No BTEX samples were collected from wells WP-15, WP-17, and WP-18 during this event.

Figure 5b is a Surfer®-generated plot of the observed benzene concentration for the October 2009 monitoring event.

4.2.2 Dissolved Metal Analytical Results

Samples for metal analytes were submitted for analyses using EPA SW846 methods 6020 (arsenic, barium, cadmium, chromium, lead, selenium, silver, calcium, magnesium, potassium and sodium) and 7470A (mercury). All samples were laboratory-filtered to exclude particles larger than 0.45 μ and acidified with nitric acid within 24-hours of collection.

Only barium is observed above WQCC concentrations regularly (discussed below). Other metals, chromium and selenium, are observed only sporadically above WQCC concentrations. Neither arsenic, cadmium, chromium, lead, mercury, selenium, nor silver were observed in concentrations exceeding the associated WQCC human health standards during either monitoring event. Table 3 presents a cumulative summary of the dissolved metals analyses.

Barium concentrations observed during the life of this investigation indicate there are no clear increasing or decreasing trends. The spatial distribution of barium concentrations above the 1.0 mg/l WQCC human health standard are primarily to the east and south of the facility, with the historically high concentrations observed in WP-17, a downgradient well in the east lobe. It appears the observed barium (and other heavy metals) in groundwater is from normal metal partitioning and disassociation from the Chinle red-bed parent soils.

April 2009 Barium Results

Analytical data indicates barium concentrations in excess of the 1.0 mg/l WQCC human health standard was only observed the following samples from the east lobe:

- WP-10 (1.95 mg/l)
- WP-11 (2.40 mg/l)
- WP-12 (1.18 mg/l)
- WP-17 (69.2 mg/l)
- WP-18 (2.34 mg/l)

December 11, 2009

Analytical data indicates the following samples exhibited barium concentrations in excess of the 1.0 mg/l WQCC human health standard in the following samples from the west lobe:

- WP-01 (3.18 mg/l)

Data quality exceptions noted in the DHL case narratives were validated, and did not adversely affect the data.

October 2009 Barium Results

Analytical data indicates barium concentrations in excess of the 1.0 mg/l WQCC human health standard was only observed the following samples from the east lobe:

- WP-10 (2.05 mg/l)
- WP-11 (2.11 mg/l)
- WP-12 (1.09 mg/l)

Analytical data indicates the following samples exhibited barium concentrations in excess of the 1.0 mg/l WQCC human health standard in the following samples from the west lobe:

- WP-01 (5.16 mg/l)

No metals samples were collected from wells WP-15, WP-17, and WP-18 during this event. Data quality exceptions noted in the DHL case narratives were validated, and did not adversely affect the data.

4.2.3 Water Chemistry Analytical Results

Water chemistry samples were analyzed for alkalinity (Standard Method M2320B), chloride and sulfate anions (Standard Method E300), and total dissolved solids (Standard Methods M2540C). Chloride, sulfate, or TDS values exceeding WQCC values were observed in all monitor wells except WP-01.

Table 4 presents a summary of water chemistry analytical results. Chlorides, sulfate, and TDS concentrations over time have very similar trends – all appear to be relatively linear with neither increasing nor decreasing trends exhibited.

April 2009 Results

Chlorides – Analytical data indicates the following samples exhibited chloride concentrations in excess of the 250 mg/l WQCC domestic water supply standard in the following samples from the east lobe:

- WP-10 (568 mg/l)
- WP-11 (469 mg/l)
- WP-12 (721 mg/l)
- WP-14 (3,540 mg/l)
- WP-15 (799 mg/l)
- WP-16 (421 mg/l)
- WP-17 (4,440 mg/l)
- WP-18 (5,180 mg/l)

Analytical data indicates the following samples exhibited chloride concentrations in excess of the 250 mg/l WQCC domestic water supply standard in the following samples from the west lobe:

- WP-06 (440 mg/l)
- WP-07 (9,450 mg/l)
- WP-19 (20,500 mg/l)
- WP-20 (8,210 mg/l)

Sulfates – Analytical data indicates only WP-14 (715 mg/l) exhibited sulfate concentrations in excess of the 600 mg/l WQCC domestic water supply standard from the east lobe.

December 11, 2009

Analytical data indicates the following samples exhibited sulfate concentrations in excess of the 600 mg/l WQCC domestic water supply standard in the following samples from the west lobe:

- WP-06 (1,750 mg/l)
- WP-07 (4,270 mg/l)
- WP-19 (3,810 mg/l)
- WP-20 (3,060 mg/l)

TDS – Analytical data indicates the following samples exhibited TDS concentrations in excess of the 1,000 mg/l WQCC domestic water supply standard in the following samples from the east lobe:

- WP-10 (2,290 mg/l)
- WP-11 (2,150 mg/l)
- WP-12 (3,180 mg/l)
- WP-13 (1,650 mg/l)
- WP-14 (8,740 mg/l)
- WP-15 (2,920 mg/l)
- WP-16 (2,300 mg/l)
- WP-17 (8,120 mg/l)
- WP-18 (11,200 mg/l)

Analytical data indicates the following samples exhibited TDS concentrations in excess of the 1,000 mg/l WQCC domestic water supply standard in the following samples from the west lobe:

- WP-04R (1,210 mg/l)
- WP-05 (1,990 mg/l)
- WP-06 (4,100 mg/l)
- WP-07 (20,000 mg/l)
- WP-19 (40,500 mg/l)
- WP-20 (18,300 mg/l)

All data was reviewed and validated, and is considered usable for this investigation. Figures 4a and 6a are Surfer®-generated plots of observed chloride and TDS concentration for the April 2009 monitoring event.

October 2009 Results

Chlorides – Analytical data indicates the following samples exhibited chloride concentrations in excess of the 250 mg/l WQCC domestic water supply standard in the following samples from the east lobe:

- WP-10 (575 mg/l)
- WP-11 (553 mg/l)
- WP-12 (751 mg/l)
- WP-14 (3,830 mg/l)
- WP-16 (421 mg/l)
- WP-21 (3,620 mg/l)
- WP-22 (2,010 mg/l)
- WP-23 (7,790 mg/l)

Analytical data indicates the following samples exhibited chloride concentrations in excess of the 250 mg/l WQCC domestic water supply standard in the following samples from the west lobe:

- WP-05 (416 mg/l)
- WP-06 (659 mg/l)
- WP-07 (9,560 mg/l)
- WP-10 (575 mg/l)
- WP-19 (21,600 mg/l)
- WP-20 (8,760 mg/l)

Sulfates – Analytical data indicates following samples exhibited sulfate concentrations in excess of the 600 mg/l WQCC domestic water supply standard from the east lobe.

- WP-14 (640 mg/l)
- WP-21 (1,460mg/l)
- WP-22 (761 mg/l)
- WP-23 (1,060 mg/l)

December 14, 2009

Analytical data indicates the exhibited sulfate concentrations in excess of the 600 mg/l WQCC domestic water supply standard in the following samples from the west lobe:

- WP-06 (1,540 mg/l)
- WP-07 (3,900 mg/l)
- WP-19 (3,870 mg/l)
- WP-20 (3,470 mg/l)

TDS – Analytical data indicates the following samples exhibited TDS concentrations in excess of the 1,000 mg/l WQCC domestic water supply standard in the following samples from the east lobe:

- WP-10 (2,340 mg/l)
- WP-11 (2,230 mg/l)
- WP-12 (3,270 mg/l)
- WP-13 (1,550 mg/l)
- WP-14 (8,430 mg/l)
- WP-16 (2,200 mg/l)
- WP-21 (8,110 mg/l)
- WP-22 (4,490 mg/l)
- WP-23 (14,800 mg/l)

Analytical data indicates the following samples exhibited TDS concentrations in excess of the 1,000 mg/l WQCC domestic water supply standard in the following samples from the west lobe:

- WP-04 (1,450 mg/l)
- WP-04R (1,380 mg/l)
- WP-05 (3,110 mg/l)
- WP-06 (3,080 mg/l)
- WP-07 (28,300 mg/l)

No general water chemistry samples were collected from wells WP-15, WP-17, and WP-18 during this event. All data was reviewed and validated, and is considered usable for this investigation. Figures 4b and 6b are Surfer®-generated plots of observed chloride and TDS concentration for the October 2009 monitoring event.

5.0 Other Investigation Activities

In the 2008 Annual Groundwater Monitoring Report the following recommendations were made:

Targa will continue monitoring groundwater semiannually. Notice will be given to the OCD at least 48-hours prior to each sampling event and results will be reported to the OCD in an annual report to be submitted during the first half of 2010. Any significant changes in groundwater quality will be reported to the OCD as soon as possible. LAI proposes the following changes for the upcoming events:

- Collecting samples for BTEX, anions and TDS laboratory analysis from monitor wells that maybe affected by past or current Gas Plant operations
- Discontinuing the collection of metals from all monitor wells
- Install three downgradient monitor wells from WP-14, WP-17, and WP-18
- Incorporate monitor wells WP-19 and WP-20, located northwest of the Gas Plant, and downgradient monitor wells, when installed, into the groundwater monitoring schedule

To date, no response from the OCD to the 2008 report has been received. All actions have been completed, except metals sample collection and analyses continued pending OCD concurrence. The following sections document the additional investigation activities.

5.1 North (#2) Brine Pond Closure

The North (#2) Brine Pond was used for temporary storage of brine water from a gas storage well located south of the pond. The brine pond measured approximately 300 x 400 x 3 feet with a nominal

December 14, 2009

capacity of approximately 64,000 barrels. The pond was lined with 60-mil high-density polyethylene (HDPE) primary liner and 20-mil thickness HDPE secondary liner. Leak detection was incorporated between the liners and an observation well was located east of the pond.

Chloride impacted groundwater is well documented as emanating from the Climax Chemical facility located immediately upgradient (northwest) of the Site. The Climax facility began operations in 1962 manufacturing sulfuric and hydrochloric acid. Chloride has been reported in groundwater from monitoring wells at the Climax facility from 6,080 milligrams per liter (mg/l) to 28,400 mg/l (Figure 4).

The North (#2) Brine Pond investigation identified concentrations of chloride in soil beneath the brine pond which were lower than the concentration of the brine that was once stored in the pond, indicating that only minor leakage may have occurred. It was concluded that the chloride levels in soil beneath the North #2 Brine Pond would not have an influence on groundwater quality due to the existing chloride impact, therefore, no remedial action was required. On October 21, 2008, the OCD approved Targa's request to fill the excavation with clean soil, with documentation that the remaining chloride contamination will not be a threat to or add contaminants to the underlying groundwater.

On December 29, 2008, LAI geologist William Green and Scarborough Drilling installed monitor well WP-19 northwest and upgradient of the former brine pond, and approximately 40 feet south of the Climax property line, and WP-20, which was installed southeast (and downgradient) of the former brine pond. Soil samples were not collected as part of this investigation. Both wells were constructed with 2-inch schedule 40 PVC installed in a 5-inch diameter boring that was advanced to approximately 50 feet below ground surface (bgs). Twenty feet of factory slotted well screen (0.020 inch) and threaded end-cap was placed in the bottom of the boring, while solid PVC pipe was set as the committer pipe to the surface. A sand filter pack of 8/16 screened Oglebay Norton silica sand was placed to about two feet above the screen, with the remainder of the annular space filled with bentonite chips to about one foot bgs. The well was secured with a locking cap and locking steel cover anchored in a 3 x 3 foot concrete pad. Groundwater stabilized in the wells at approximately 31 feet bgs. Table 1 presents a summary of the well completion details along with groundwater gauging data.

Groundwater samples were collected from the newly-installed wells on January 6, 2009. The samples were submitted to DHL Analytical, Inc. (DHL) in Round Rock, Texas for laboratory analyses. DHL is a National Environmental Laboratory Accreditation Program accredited laboratory. Laboratory analytical results did not identify any petroleum hydrocarbon constituents (benzene, toluene, ethylbenzene or total xylenes, BTEX) or heavy metal contaminants above Water Quality Control Commission (WQCC) human health standards (Table 2 and 3, respectively). Benzene concentrations observed in groundwater are presented as Figure 5.

Chloride, sulfate and Total Dissolved Solids (TDS) concentrations in both wells exceeded WQCC domestic water quality standards (Table 4). Observed concentrations were higher in the upgradient well (WP-19) than the downgradient well (WP-20) for these three parameters. Values reported are as follow:

- Chlorides – WP-19, 17,700 mg/l; WP-20, 7,780 mg/l
- Sulfates – WP-19, 4,020 mg/l; WP-20, 3,310 mg/l
- TDS – WP-19, 38,000 mg/l; WP-20, 17,300 mg/l

December 14, 2009

Based on these results, it does not appear that the North (#2) Brine Pond has adversely affected groundwater underlying the former pond. The final closure report was submitted to the OCD on July 16, 2009.

5.2 East Lobe Plume Delineation

Previously, the OCD determined that past oil-field brine and hydrocarbon contamination has affected the regional High Plain Aquifer and is only requiring the refinery to recover hydrocarbon product floating on top of the groundwater within the aquifer and to delineate the extend of hydrocarbon contamination (Appendix C). Phase-separated hydrocarbons (PSH) recovery was initiated in 1989, with mechanical (pump) removal evacuating 26,348.5 gallons by October 1991. The product recovery system operated until April 1997, when operations ceased due to low water table conditions and pump recovery. Manual skimming operations resumed c2005, with PSH thicknesses steadily declining. Currently only WP-15 and WP-18 exhibit sporadic accumulations, generally below 0.05 foot thick. Continued PSH recovery is considered technically impracticable, as defined in EPA Office of Solid Waste and Emergency Response Directive 9234.2-25 (September 1993).

On May 26 and 27, 2009, LAI geologist William Green and Scarborough Drilling installed three monitor wells with the goal of delineating the extent of hydrocarbon contamination. WP-21 was the eastern-most well, near Maddox Road; WP-22 is situated northwest of Apache's JR Phillips Gas Com Well; WP-23 is the southern-most well and is located southeast of the Monument Gas Plant. Soil samples were not collected as part of this investigation. The wells were constructed with 2-inch schedule 40 PVC installed in a 5-inch diameter boring that was advanced to between 50 and 60 feet bgs. Twenty feet of factory slotted well screen (0.020 inch) and threaded end-cap was placed in the bottom of the boring, while solid PVC pipe was set as the committer pipe to the surface. A sand filter pack of 8/16 screened Oglebay Norton silica sand was placed to about two feet above the screen, with the remainder of the annular space filled with bentonite chips to about one foot bgs. The well was secured with a locking cap and locking steel cover anchored in a 3 x 3 foot concrete pad. Groundwater stabilized in the wells at 36.76, 39.12 and 37.19 feet below TOC. Table 1 presents a summary of the well completion details along with groundwater gauging data. Figure 2 presents the monitoring well location.

Groundwater samples were collected from the newly-installed wells on May 28, 2009. The samples were submitted to DHL for BTEX, chloride, sulfate and TDS analyses. Laboratory analytical results only identified benzene in WP-23 (0.00145 mg/l), but at values below the WQCC human health standard (0.010 mg/l, Table 2).

Chloride, sulfate and Total Dissolved Solids (TDS) concentrations in all three wells did exceed WQCC domestic water quality standards (Table 4). Values reported are as follow:

- Chlorides – WP-21, 3,750 mg/l; WP-22, 2,480 mg/l; WP-23, 9,180 mg/l
- Sulfates – WP-21, 1,510 mg/l; WP-22, 832 mg/l; WP-23, 1,210 mg/l
- TDS – WP-21, 8,380 mg/l; WP-22, 5,360 mg/l; WP-23, 16,000 mg/l

Observed benzene, chloride, and TDS concentrations from May are incorporated in the Surfer maps for the April 2009 monitoring event (Figures 5a, 4a, and 6a, respectively). Based on these results, it appears that hydrocarbons in groundwater delineation has been achieved.

December 14, 2009

6.0 Conclusions Based Upon Current Investigation Data

The following observations are documented in this report:

- Groundwater flow direction remains bifurcating to the southeast and the south at variable gradient from north to south
- WP-02 remained dry, as it has since September 20, 2007
- Product was detected in east lobe monitor wells in both sampling events
- Benzene and chloride remain in groundwater
- Barium concentrations in groundwater appear to be a disassociation byproduct that is naturally occurring within the soil
- North (#2) Brine Pond has not adversely affected groundwater underlying the former pond
- Hydrocarbon plume delineation has been achieved

7.0 Recommendations

Since the removal of free-phase hydrocarbon and the dissolved phase hydrocarbon plume has been delineated, and no further investigation is recommended. It is further recommended that the existing monitor well remain, and Targa conducts annual gauging and sampling for general water chemistry and BTEX events for plant records, and inclusion in Groundwater Discharge Permit renewals. Targa will resume product recovery should PSH thickness measurements indicate recovery is technically feasible. Targa will notify the OCD at least 48 hours prior to the annual monitoring events, and as soon as possible to any significant change in analyte concentrations.

Notes

All values are in feet, unless otherwise noted.

TOC - top of casing

Elevations are referenced to 1984 Geodetic Datum.

LNAPL sheens are presented as 0.00 foot thickness

Mr. Ken Stinson
Warren Petroleum Company
P.O. Box 67
Monument, New Mexico 88265

**RE: GROUND WATER CONTAMINATION
WARREN MONUMENT GAS PLANT
LEA COUNTY, NEW MEXICO**

Dear Mr. Stinson:

The New Mexico Oil Conservation Division (OCD) has recently reviewed the status of the ground water investigation and remedial activities at the Warren Petroleum Company's (WPC) Monument Gas Plant. While the remedial actions taken by WPC to date are satisfactory, the extent of contamination related to WPC's activities at the facility has never been completely defined. The OCD discussed this issue during a meeting with you on June 30, 1994

Based upon the OCD's review, the OCD requests that WPC submit a work plan to complete the definition of the extent ground water contamination related to WPC's activities at the Monument Gas Plant. Please submit the work plan to the OCD Santa Fe Office by September 9, 1994.

If you have any questions, please contact me at (505) 827-5885.

Sincerely,

A handwritten signature in black ink, appearing to read "William C. Olson".

Jimmie T. Cooper
Box 55
Monument, NM 88265

Dear Sir:

This letter is to inform you of Climax Chemical Company's petition to the New Mexico Environment Department's Hazardous and Radioactive Materials Bureau (HRMB) requesting Alternate Concentration Limits for hazardous constituents present in the groundwater below the Climax Chemical facility west of Monument, New Mexico. Groundwater samples taken from the upper-most aquifer below Climax Chemical Company's Monument, New Mexico plant contain Cadmium, Silver, I,I,I,I, Trichloroethylene and Ethylene Dichloride in concentrations above the safe drinking water standards. Climax Chemical has provided evidence that Alternate Concentration Limits should be granted because the contamination does not pose a threat to human health or the environment. The requested limits are above the safe drinking water standard and could pose a danger to human health should individuals drink, eat or inhale significant amounts of contaminated water or soils. The health of individuals who do not intend to use the groundwater or come in contact with it would not be threatened.

Climax Chemical Company's Monument, New Mexico plant is located three miles west of Monument, New Mexico in Lea County. The plant is a producer of hydrochloric acid and sodium sulfate. Immediately adjacent to and downgradient of Climax Chemical is the Warren Petroleum Company (Chevron) refinery. The upper-most aquifer beneath the refinery has been significantly impacted by hydrocarbon contamination. Due to past oil-field brine contamination of this same aquifer the Oil Conservation Division (OCD) of the New Mexico Energy Minerals and Natural Resources Department is only requiring the refinery to recover hydrocarbon product floating on top of the groundwater within the aquifer.

Climax Chemical Company's argument for granting the Alternate Concentration Limits is: "the water downgradient from Climax Chemical has been contaminated beyond usability by the petroleum industry through brine disposal and hydrocarbon leakage. The addition of Heavy Metal and Volatile Organic contamination above the safe drinking water standard as the Climax plume moves through this area will not adversely affect the usability of the aquifer, since it is already unusable without the effect of Climax's constituents."

At this time the HRMB has no evidence that landowners are using groundwater from the contaminated aquifer. Should you now be using or anticipate using groundwater from the upper-most aquifer beneath your property and have questions or comments concerning the petition for granting of Climax Chemical Company's petition request for Alternate Concentration Limits please contact Steve Alexander

at 827-2929 or write: New Mexico Environment Department, Hazardous and Radioactive Materials Bureau, 1190 Saint Francis Drive, P.O. Box 26110, Santa Fe, New Mexico, 87502, Attention: Steve Alexander. Please respond within thirty (30) days following receipt of this notification.

Sincerely,

Steven M. Alexander, Water Resources Specialist
Hazardous and Radioactive Materials Bureau
New Mexico Environment Department
