Monthly Report for the Month ending August 31, 2013 (8/1/13-9/1/13) Pursuant to Workover C-103 for Linam AGI #1

This is the sixteenth monthly submittal of data as agreed to between DCP and OCD relative to injection pressure, TAG temperature and casing annulus pressure. As shown on the attached graphs, there has continued to be some fluctuation in the data due to fluctuating gas flows due to power failures from lightning. DCP continues to implement modified operational procedures to better maintain the pressure and temperature conditions in the well in order to minimize the opportunity for corrosion in the tubing. Average temperatures and pressures for the report period are as follows: TAG Injection Pressure: 1565 psig, Annulus Pressure: 94 psig, TAG Temperature: 121°F, and Pressure Differential: 1472 psig.

The data clearly show the effect of the changing temperature and pressure in the annulus and continue to demonstrate clearly that the workover successfully eliminated all connection between the tubing and the annular space. At several times during the month of August the AGI facility had some power outages due to lightning which caused brief shutdowns and corresponding variations in temperature and pressure. See attached graphs containing explanation of observed trends and excel spreadsheet for raw data. All the data continue to confirm the integrity of the tubing which was replaced last year and the well continues to serve as a safe, effective and environmentally-friendly system to dispose of Class II wastes consisting of H₂S and CO₂.

I hereby certify that the information above is true and complete to the best of my knowledge and belief.

Conditions of Approval (if any):

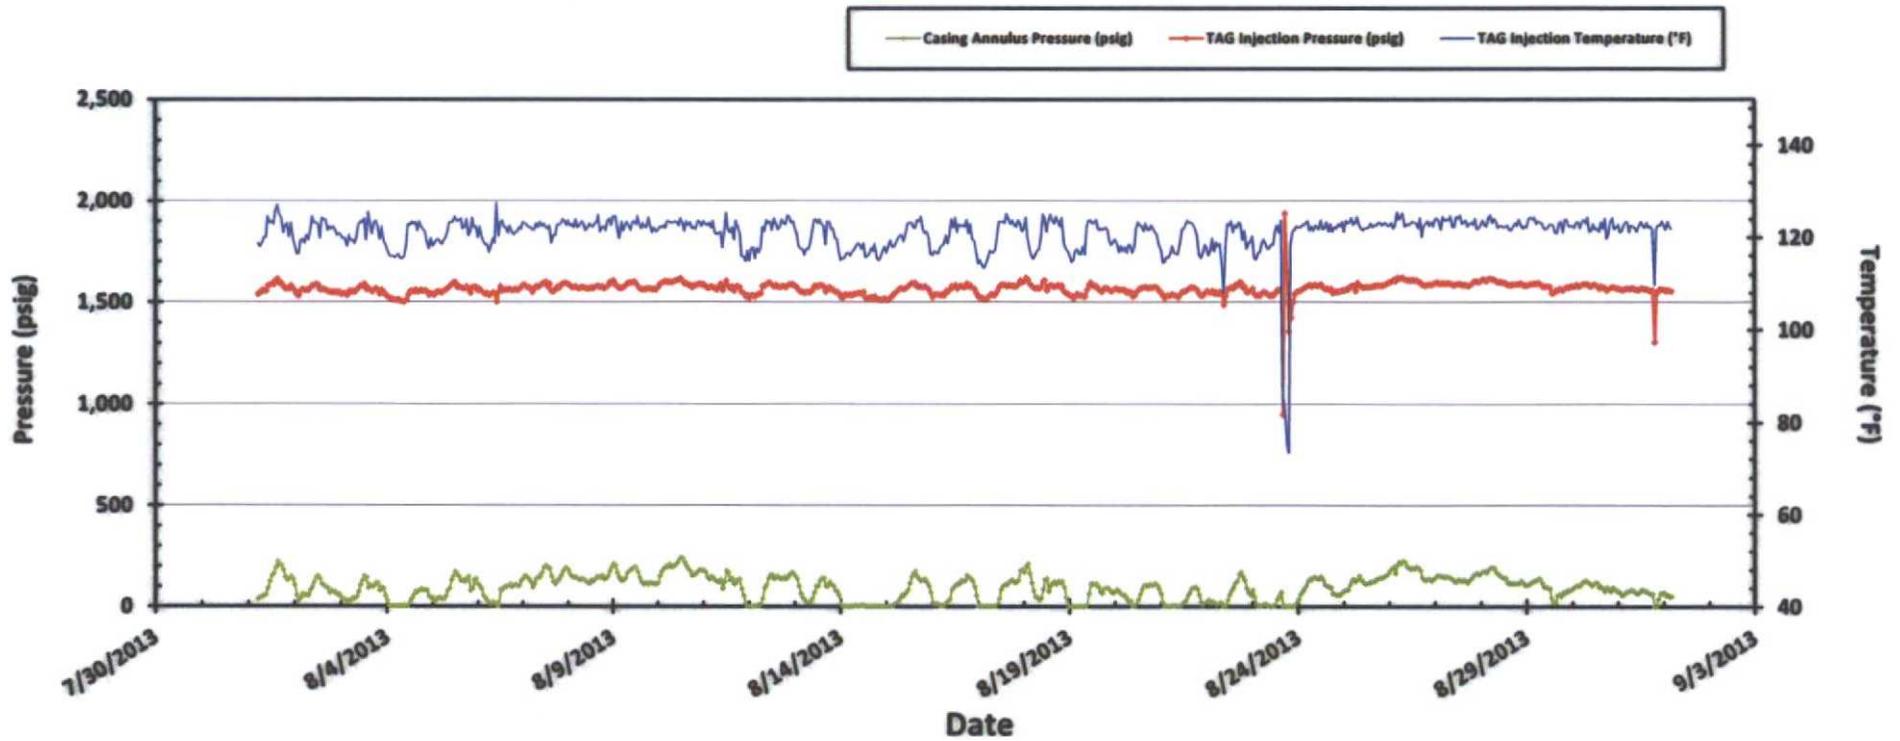

Linam AGI #1 Injection and Casing Annulus Pressure and TAG Injection Flowrate 8/1/2013 to 9/1/2013

Fluctuations in annular pressure observed during the month of August 2013 primarily represent the correlative behavior of the annular pressure with the flowrate and injection pressure. There were several temporary shutdowns of the plant during the month of August due to power failures at the AGI facility. These issues were generally corrected within hours. On 8/23 a lightning strike resulted in a power outage at the AGI facility which was resolved within a few hours. At these times the annular pressure drops significantly when injection rates are reduced, as can be seen on the graph. The effect is also visible on the pressure/temperature graphs during the same period as the flow drops and temperature varies. These drops are also associated with decreased annular pressure, as demonstrated on the graph. The significant spread between TAG injection pressure (inside tubing) and the annular pressure proves the continuing integrity of the well and the tubing.

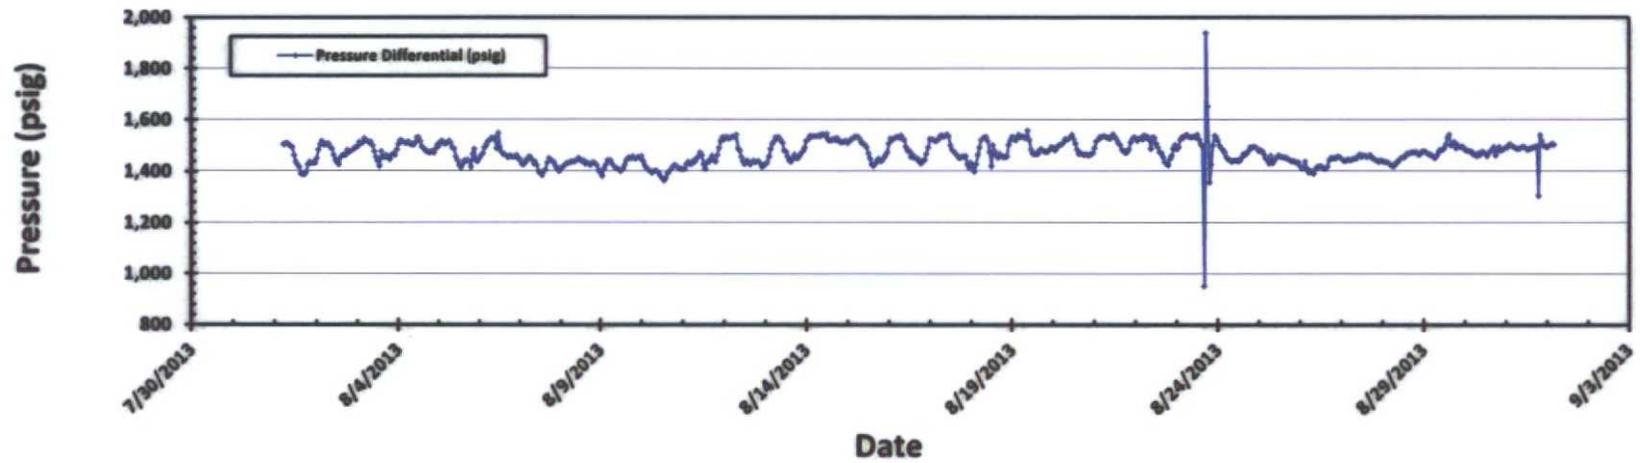

— TAG Injection Flowrate (scf/h) — TAG Injection Pressure (psig) — Casing Annulus Pressure (psig)

Linam AGI #1 TAG Injection Pressure, Casing Annulus Pressure and TAG Injection Temperature 8/1/2013 to 9/1/2013

Linam AGI #1 TAG Injection Pressure and Casing Annular Pressure Differential (psig) 8/1/2013 to 9/1/2013

Re: August C-103 monthly report, Linam AGI #1

Dear Mr. Gonzales:

This letter serves as DCP Midstream, LP's (DCPM) response to file a monthly C-103 report with the OCD. DCPM will continue to operate as per our original approved injection order as modified by the C-103 approved on 5/3/2012 which requires monthly reporting and MIT every 6 months.

If you have any questions about the information included in this submittal, please feel free to contact me at 575-397-5505 or via email at [SJHarless@dcpmidstream.com](mailto:SHarless@dcpmidstream.com).

Sincerely,

Steve Harless
General Manager of Operations, SENM
