

MEMO

TO: Clint Richardson, Ph.D, PE, BCCEE
FROM: Robert H. (Holly) Holder, PE
PROJECT NAME: C.K. Disposal E & P Landfill and Processing Facility
PROJECT NO.: 01-0580-15
DATE: April 1, 2016

In response to the letter dated March 25, 2016 regarding the initial assessment of the permit application, PSC is providing calculations sealed and signed by the engineer of record, Mr. Nicholas Ybarra, PE for the following items:

1. Volumetric calculations as per cover requirements
2. Soil erosion estimates for rain and wind erosion
3. Anchor trench capacity
4. Foundation settlement as it affects leachate collection
5. Waste settlement as it affects the top slope and surface drainage features
6. Leachate pipe performance as per deflection
7. Liner stability and tensile stress under filling as per a multi-layered liner
8. Waste stability via translational failure upon filling

As you and I discussed earlier this week by telephone the following items are not included at this time. We understand that these items, listed as A-E below, were not required for the most recent permit approval. If it is determined by OCD that these calculations are preferred for permit approval, please notify me and we will comply as quickly as possible.

- A Outside slope stability (static and pseudostatic)
- B Final veneer stability for a multi-layered liner sequence
- C Geotextile evaluation as per retention, permittivity, and porosity for leachate collection
- D Minimum liner thickness based on projected overburden
- E Geonet compression under overburden loading

If it is determined items A through E are required, we will so provide as soon as practical.

The following is a summary of the results from each calculation above:

1. Volumetric calculations as per cover requirements:

For the final cover, protective cover, waste footprint perimeter berm, and daily/intermediate cover (20% of waste capacity) cover we will use 5,585,742 cubic yards of soil. Based on a cut and fill analysis performed on site we had an excess of 7,717,488.61 cubic yards of cut soil available. The site will have approximately 2,131,746.6 cubic yards of excess soil.

2. Soil erosion estimates for rain and wind erosion:

For erosion due to rain we used the RUSLE method. We estimate that we will lose 4.51 tons/acre/year due to rain. NRCS specifies a target rate of less than 5 tons/acre/year for non-farm application, therefore we are within the target range of NRCS.

(#2 continued) Wind erosion we used the National Agronomy Manual's Wind Erosion Equation. Using the attached E table we estimate that wind erosion will account for 1.2 tons/acre/year. NRCS specifies a target rate of less than 2.5 tons/acre/year for non-farm application, therefore we are within the target range of NRCS.

3. Anchor Trench Capacity:

Using an equation from Geotechnical Aspects of Landfill Design and Construction we found the tension on the geomembrane to be 2,067 lbs/in² this is less than the yield strength of GSE 60 mil liner. Therefore the anchor trench is adequately sized.

4. Foundation settlement as it affects leachate collection:

Attached spreadsheets show that no slopes for the leachate collection were decreased below the required 2% slope.

5. Waste Settlement:

Attachment spreadsheet shows the angular distortion. All angular distortions were minor and less than the design slopes for the drainage system. With the settlement the site will still have positive drainage.

6. Leachate Pipe performance:

We evaluated both PVC pipe and HDPE pipe for performance in regard to deflection. We found a 8.1% deflection in the PVC pipe which is well below the 30% deflection that is the critical value from the Handbook of PVC Design. The HDPE pipe had a deflection of 7% which is below the standard of 8% from Performance Pipe Engineering Manual for HDPE pipe; therefore either pipe could be used on site.

Wall buckling was evaluated for PVC and HDPE pipe as well. For the PVC pipe we calculated that the site would produce 82.6 psi which has a factor of safety of 13.6 compared to the critical value of PVC pipe. The HDPE pipe had an actual value of 182.4 psi on site. We calculated a factor of safety of 1.86 for the HDPE pipe which is adequate.

The HDPE pipe was also evaluated for wall crushing. Our calculations show a 1.65 factor of safety between our actual value of 910 psi and the critical value of 1,500 psi.

7. Liner stability and tensile stress under filing as per a multi-layered liner:

Using interface friction angles we calculated the liner stability of each layer of liner. We calculated the shearing force and the friction force for each liner interface. All friction forces were greater than the shearing force; therefore, the liner is stable.

Equipment loading was also considered for the liner system. We used a D6N CAT dozer for the equipment loading calculation. The tensile stress in the geocomposite = 4,184 lbs/ft and the resistant force in the geocomposite = 12,036 lbs/ft. Therefore the tensile stress in the geocomposite = -7,852 lbs/ft, which indicates that the geocomposite is not in tension.

8. Liner stability via translational failure upon filling:

We found the total weight of the active and passive wedge at the site. With the calculated weights and the interface friction angles we found a factor of safety of 2.3. This indicates that the passive wedge will adequately support the active wedge on the sideslopes without slippage of geosynthetics.

Soil Volumetrics of site

A cut and fill analysis was computed for our site. The analysis accounts for all excavation, drainage and grading for the site.

CUT	Fill	Net
8,215,177.16 CY	497,688.55 CY	7,717,488.61 CY

$$\text{Waste capacity for site} = 20,897,298 \text{ CY}$$

Protective Soil cover Volume (Sp)

$$\text{Surface area of liner} = 709060 \text{ SF}$$

$$\text{Protective soil cover thickness} = 2' = (2/3) \text{ yds}$$

$$\text{Volume of soil for protective soil cover} = 472,707 \text{ CY} = Sp$$

Final Cover Soil Volume (SFC)

$$\text{Surface area of Final Cover} = 696,338 \text{ SF}$$

$$\text{Final cover thickness} = 3' + 1' (\text{Intermediate cover}) = 4' = (4/3) \text{ yds}$$

$$\text{Volume of soil for Final cover} = 928,451 \text{ CY} = SFC$$

Perimeter berm Soil Volume (SP)

$$\text{Perimeter around waste footprint} = 9,881.36'$$

$$\text{Volume of soil for Waste perimeter berm} = (9,881.36 \text{ ft})(14 \text{ sf}) = 138,339 \text{ ft}^3$$

$$\text{Volume of soil for Waste perimeter berm} = 5,124 \text{ CY} = SP$$

Volume of soil for Protective cover, Final cover and Perimeter berm

$$Sp + SFC + SP = 472,707 \text{ CY} + 928,451 \text{ CY} + 5,124 \text{ CY} = 1,406,282 \text{ CY} = TS$$

Drawn By
Date 3/30/2016 Sheet 2 of 2

Volume of soil for Protective cover, Final cover and Perimeter Berm

$$S_{Pct} + S_{FC} = 1,406,282 \text{ CY}$$

Assume that 20% of the landfill capacity will be used for daily and intermediate cover

$$\text{Waste capacity} = 20,897,298 \text{ CY}$$

$$S_{di} = \text{daily and intermediate soil cover volume} = (20,897,298 \text{ CY}) (0.2)$$

$$\text{daily and intermediate soil cover volume} = 4,179,460 \text{ CY} = S_{di}$$

$$S_{Pct} + S_{FC} + S_{di} = S_t = 1,406,282 \text{ CY} + 4,179,460 \text{ CY}$$

$$S_t = 5,585,742 \text{ CY}$$

$$\text{Net Cut and fill} = 7,717,488.61 \text{ CY (surplus)}$$

Excess Soil remaining after cover and perimeter berms are constructed = S_E

$$S_E = 7,717,488.61 \text{ CY} - 5,585,742 \text{ CY}$$

$$S_E = 2,131,746.61 \text{ CY excess}$$

$$\% \text{ of Soil Remaining} = \frac{S_E}{\text{Net cut and fill}} (100) = \frac{2,131,746.61 \text{ CY}}{7,717,488.61 \text{ CY}} (100) = 27.6\%$$

The Site Will have excess soil remaining after protective cover, Final cover, Daily cover, Intermediate cover and Waste perimeter berm have been constructed.

Soil Erosion Estimate for Rain and Wind Erosion

- Final cover crown max slope = 4%
- Side slope of Final Cover = $4H:IV = 25\%$
- Final cover was conservatively assumed to have 50% coverage of vegetation
- Target erosion rates is less than 5.0 tons/acre/year for rainfall and 2.5 tons/acre/year for wind erosion. These values are from NRCS for non farm applications
- Design erosion rate shall not exceed the soil erosion layer of the final cover which is 12 inches thick

RUSLE was used for Soil Losses due to rainfall

$$A = R \times K \times L \times S \times C$$

A = Soil Loss per unit Area (tons/acre/year)

R = rainfall/runoff factor based on site specific climate = 45

K = Soil Erodibility factor based on Soil type = 0.15

- Sand and Silty Sand is predominately on site

L = Length Slope factor = $\left(\frac{L_h}{72.6}\right)^m$ L_h = horizontal slope length m = slope length exponent

S = Slope factor = $(6.85 \sin(\text{slope angle})) - 0.5$

C = Cover factor = $C_{PLU} C_{cc} C_{sc} C_{se}$

C_{PLU} = Prior Landuse (Design Hydrology and Sedimentology for Small Catchments) = 0 (rangeland)

C_{cc} = Canopy cover (Design Hydrology and Sedimentology for small catchments) = $1 - F_c \cdot \exp(-0.1) H$

F_c = surface covered by canopy = 0.5

H = canopy height in feet = 1 ft

$$C_{cc} = 1 - (0.5) \cdot \exp(-0.1)(1) = 0.55 = C_{cc}$$

$$(C_{sc} = \exp(-b R_c (\frac{6}{6+R_G})^{0.08}))$$

R_c = Fraction ground cover = 0.5 for 50% veg cover

$$R_G = \text{Surface Roughness} = (25.4 R_R - 6) (1 - e^{-0.0015 R_S})^{-0.14 P_f}$$

$R_R = 0.8$ = Random Roughness (DHASFSC)

$R_S = 12.00$ from DHASFSC

$P_f = 10.72$ inches from Western Regional Climate Center (Hobbs, New Mexico)

$B = 4.5$ (constant)

$$R_G = (25.4(0.8) - 6) (1 - e^{-0.0015(12.00)})^{-0.14(10.72)} e$$

$$R_G = (14.32)(0.8347)(0.1938)$$

$$R_G = 2.32$$

Continued on next page

$$C_{sc} = \exp(-b R_c \left(\frac{C}{6+R_c} \right)^{0.08})$$

$$C_{sc} = \exp(-4.5(0.5) \left(\frac{6}{6+2.32} \right)^{0.08}) = \exp(-2.1919)$$

$$\underline{C_{sc} = 0.11}$$

$$C_{sr} = \text{Surface Roughness} = e^{-0.026 R_c}$$

$$C_{sr} = e^{-0.026(2.32)} = 0.94 = \underline{C_{sr}}$$

$$C_{sm} = \text{Soil moisture} = 1.0 \text{ for rangeland}$$

$$C = C_{plu} C_c C_{sc} C_{sr} C_{sm}$$

$$C = (1)(0.55)(0.11)(0.94)(1)$$

$$\underline{C = 0.06}$$

RUSLE Soil Loss for Final Cover (A_c)

$$A_c = R \times K \times L \times S \times C \quad L = \left(\frac{L_h}{72.6} \right)^m = \left(\frac{12.64}{72.6} \right)^{0.36} = 2.80$$

$$A = (45)(0.15)(2.80)(0.17)(0.06) \quad L_h = 12.64 \quad m = 0.36 \text{ (HASFSC)}$$

$$A_c = 0.19 \text{ tons/acre/year}$$

$$S = (16.8 \sin(22.9)) = 0.5$$

$$S = 0.17$$

RUSLE Soil Loss for Sideslope of Final Cover (A_s)

$$A_s = R \times K \times L \times S \times C \quad L = \left(\frac{L_h}{72.6} \right)^m = \left(\frac{400}{72.6} \right)^{0.64} = 2.98$$

$$L_h = 400$$

$$m = 0.64$$

$$S = (16.8 \sin(14.04)) = 0.5$$

$$A_s = (45)(0.15)(2.98)(3.58)(0.06) \quad S = 3.58$$

$$\underline{A_s = 4.32 \text{ tons/acre/year}}$$

$$A_t = A_c + A_s = 0.19 \text{ tons/acre/year} + 4.32 \text{ tons/acre/year}$$

$$\underline{A_t = 4.51 \text{ tons/acre/year}}$$

With 50% vegetative cover, the soil loss is 4.51 tons/acre/year
 Target erosion rate (NRCs) = 5 tons/acre/year > 4.51 tons/acre/year = site value

PARKHILLSMITH&COOPER

Project C.K. Disposal E&P Landfill and Processing Facility
Job No. 01-0580-15
Subject Rain and Wind Erosion
Drawn By _____
Date 3/30/2016 Sheet 3 of 4

Soil Losses Due to Wind

- Use the "National Agronomy Manual" 3rd Edition, Oct. 2002

- Soil type on site is predominately Loamy fine sands (Web Soil Survey)

Wind Erosion Equation

E is a function of I, K, L, C, V

E = Potential average annual soil loss (tons/acre/year)

I = Soil Erodibility Index (tons/acre/year)

K = Ridge Roughness factor (0.5 - 1.0)

C = Climatic Factor

L = Unsheltered Distance along prevailing wind direction across the area being evaluated

V = Equivalent Vegetative Cover

Soil Erodibility Index "I" (National Agronomy Manual Exhibit 502-2)

$$I = 134 \text{ tons/acre/year}$$

Ridge Roughness factor "K"

No windbreak ridges are proposed for the final cover.

So a "K" value of 1.0 was selected

$$K = 1.0$$

Climatic Factor "C" (Agronomy Tech Note 27, June 1992)

$$C = 150$$

PARKHILLSMITH&COOPER

Project C.K. Disposal E&P Landfill and Processing Facility
Job No. 01-0580-15
Subject Rain and Wind Erosion
Drawn By _____
Date 3/30/2016 Sheet 4 of 4

Unsheltered Distance along prevailing wind direction "L"

$$L = 2,321 \text{ ft}$$

According to a wind rose from the Hobbs Lea County Airport, the predominante wind direction is from the south.

The longest unsheltered distance along the South wind is the western edge of the final cover. L is the length from the South west waste footprint to the northwest waste footprint.

Equivalent Vegetative Cover "V" (National Agronomy Manual)

Our final cover quality control plan calls for seeding in accordance with USDA rules and the Federal Seed Act. With native and drought resistant grasses to be seeded, we should see about 1,500 pounds per acre of vegetative cover.

Using 1,500 lbs/AC for veg cover and pg. 502-92 of the "National Agronomy Manual" we get a $V > 3,000$.

Since E Tables only extend to 3,000 we will use:

$$V = 3,000$$

E Table to Solve (NRCS Wind Erosion Equation (WEQ) site

E Table from the website with the following parameters

$$I = 134 \text{ tons/acre/year}$$

$$K = 1.0$$

$$C = 150$$

$$L = 2,321 \text{ ft}$$

$$V = 3,000$$

We get that $E = 1.7 \text{ tons/acre/year}$

Wind Erosion onsite = 1.7 tons/acre/year

NRCS target value = 2.5 tons/acre/year

Wind erosion onsite < NRCS Target value for Wind Erosion

PARKHILLSMITH&COOPER

Project C.K. Disposal (E4 Landfill and Accessory Facility)
 Job No. 01-0580-15
 Subject Anchor Trench Capacity
 Drawn By
 Date 3/30/2016 Sheet 1 of 1

Anchor Trench Capacity

The geocomposite/Double Sided Textured HOPE Liner has the minimum Inter face friction angle and will be the limiting Interface.

$$T = \frac{(y_s)(d_{cs})(L_{ro})(\tan \delta_c) + [(1 - \sin \theta)(y_s(d_{cs} + 0.5d_{AT}))d_{AT} + y_s(d_{cs} + d_{AT})L_{AT}](\tan \delta_c + \tan \delta_f)}{\cos \beta - \sin \beta \tan \delta_c}$$

$$y_s = 110 \text{ pcf}$$

$$d_{cs} = \text{depth cover soil} = 2'$$

$$L_{ro} = \text{Runout Length} = 2'$$

$$\delta_c = \text{Friction angle of geocomposite/Double sided Textured HOPE} = 20.1^\circ$$

$$\theta = \text{Friction angle of compacted backfill} = 35^\circ$$

$$d_{AT} = \text{depth anchor trench} = 2'$$

$$L_{AT} = \text{width anchor trench} = 2'$$

$$\delta_f = \text{friction angle between geomembrane and compacted backfill} = 32^\circ$$

$$\beta = 14.04$$

$$T = \frac{(110 \text{ pcf})(2)(2)(\tan(20.1)) + [(1 - \sin(35))(110 \text{ pcf})(3)(2) + 110(2+2)(2)](\tan(20.1) + \tan(32^\circ))}{\cos(14.04) - (\sin(14.04))\tan(20.1)}$$

$$\cos(14.04) - (\sin(14.04))\tan(20.1)$$

$$T = 161.02 + \frac{[(0.426)(660) + 280]0.9908}{.881} = 1,488.6 \text{ lbs/ft}$$

$$= 1241 \text{ lbs/in}$$

GSE use 126 lbs/in width as the yield Strength for 60 mil HOPE

$$\frac{126 \text{ lbs/in}}{0.06 \text{ in}} = 2,100 \text{ lbs/in}^2$$

$$\frac{1241 \text{ lbs/in}}{0.06 \text{ in}} = 2,067 \text{ lbs/in}^2$$

So our value of 2,067 lbs/in² is less than GSE yield strength so the anchor trench is adequately sized.

Foundation Settlement

$$Z_e = \left(\frac{\Delta \sigma}{M_s} \right) H_0$$

Z_e = elastic settlement of soil layer (ft)
 H_0 = initial thickness of soil layer (ft)
 $\Delta \sigma$ = increment of vertical effective stress (lbs/ft^2)

$$M_s = \text{Constrained Modulus of Soil (lbs/ft^2)}$$

$$E_s = \text{Elastic modulus of soil (lbs/ft^2)}$$

$$v_s = \text{Poisson's ratio}$$

$$M_s = \frac{E_s(1-v_s)}{(1+v_s)(1-2v_s)}$$

unit weight of soil = 110pcf, E_s & v_s values were found using "Geotechnical Aspects of landfill Design and construction".
 unit weight of waste = 74pcf

$\Delta \sigma$ = waste effective stress + protective soil/cover effective stress + intermediate cover effective stress + final cover effective stress

$$\Delta \sigma = (157' (74\text{pcf})) + (2')(110\text{pcf}) + (1)(110\text{pcf}) + (3)(110\text{pcf})$$

$$\Delta \sigma = 12,278 \text{ lbs}/\text{ft}^2$$

SM soil type was used for E_s & v_s (90%) calculations

$$E_s(90\%) = \frac{4700 \text{ psi} + 16,000 \text{ psi}}{2} = (0.350 \text{ psi})(144) = 1,490,400 \text{ lbs}/\text{ft}^2$$

$$v_s(90\%) = 0.29$$

$$M_s = \frac{1,490,400(1-0.29)}{(1+0.29)(1-2(0.29))} = \frac{1058184}{0.5418} = 1,953,090 \text{ lbs}/\text{ft}^2$$

$$Z_e = \frac{(12,278 \text{ lbs}/\text{ft}^2)(40)}{1,953,090 \text{ lbs}/\text{ft}^2} = 0.251 \text{ ft} = 3 \text{ inches} = Z_e$$

H_0 = compressible soil depth = 40'

Attached spreadsheet has settlement calculations for the points shown in Figure 1.

The required 2% slope of the leachate collection system is not adversely effected by foundation settlement.

Subject Pipe Performance Calculs

Drawn By

Date March 28, 2016 Sheet 2 of 7

Load of pipe with perforations

- Static Vertical load per Unit length of pipe (w_c)

$$w_c = \frac{(P_T)(D_o)}{(1 - ((n)(d)/12))}$$

(Geotechnical Aspects of Landfill Design and Construction)

$$P_T = \text{design load (psi)} = 82.6$$

$$D_o = \text{Outside diameter (in)} = 6.625$$

$$n = \text{Number of perforations per foot of pipe} = 6123$$

$$d = \text{diameter of perforated hole (in)} = 0.5$$

$$w_c = \frac{(82.6)(6.625)}{(1 - (12)(0.5)/12)} = \frac{547.725}{0.5} = 1094.45 \text{ lbs/in}$$

$$= 13,133.4 \text{ lbs/ft}$$

Deflection

$$\Delta x = \frac{(D_L)(K)(w_c)(r^3)}{(E)(I) + 0.061(E')(r^3)}$$

(Geotechnical Aspects of Landfill Design and Construction)

D_L = Conservative value of 1.5 for lag or time dependent behavior

K = bedding constant for support from the bottom of the trench

($K = 0.083$ for a bedding angle of 180°)

r = Mean radius of pipe = $(6.625 - 0.432)/2 = 3.1$ in

E = Modulus of elasticity = $400,000 \text{ psi}$

E' = Modulus of passive soil resistance in crushed rock = 3000 psi

I = Moment of inertia = $I = \frac{\pi r^4}{4} - \frac{0.432^4}{12} = 0.0067 \text{ in}^4/\text{in}$

$$\Delta x = \frac{(1.5)(0.083)(1094.45)(29.79)}{(400000)(0.0067) + 0.061(3000)(29.79)}$$

$$= 4059.2 \text{ lbs/in}^2$$

$$= 0.5 \text{ in}$$

$$\frac{2680 + 5451.6}{8131.57}$$

Ring Deflection (R_D) (Geotechnical Aspects of Landfill Design and Construction)

$$\% R_D = [\Delta x / (D_i + t)] \times 100$$

D_i = Internal pipe diameter

t = wall thickness

$$\% R_D = [0.5 / (5.76 + 0.432)] \times 100$$

$$\% R_D = 8.1\%$$

Wall Buckling (Geotechnical Aspect of Landfill Design and Construction)

$$\text{Critical buckling Pressure } (P_{cr}) = (2) \left\{ [(E') / (1 - v^2)] \left[\frac{(E)(I)}{r^3} \right] \right\}^{1/2}$$

E' = Modulus of Soil reaction = 3,000 psi

E = Modulus of Elasticity of pipe = 400,000 psi

v = Poisson's Ratio = 0.38 for PVC pipe (Handbook of PVC Pipe Design)

I = Moment of Inertia = 0.0067 in⁴/in

t = pipe wall thickness = 0.432 in

r = mean radius of pipe = 3.1 in

$$P_{cr} = 2 \left\{ \left(\frac{3000}{(1 - 0.38^2)} \right) \left(\frac{(400000)(0.0067)}{29.79} \right) \right\}^{0.5}$$

$$P_{cr} = 2 \left\{ \left(\frac{3000}{0.8556} \right) (89.96) \right\}^{0.5}$$

$$P_{cr} = 2 \left\{ 561.64 \right\} = 1,123.3 \text{ psi}$$

Factor of Safety (FS)

FS = P_{cr} / Actual Total load

$$FS = \frac{1,123.3 \text{ psi}}{82.6 \text{ psi}} = \underline{\underline{13.6}}$$

PARKHILLSMITH&COOPER

Job No. 01-0580-15

Subject Pipe Performance Calc's

Drawn By

Date March 28, 2016 Sheet 4 of 7

Equipment Loading

- Type of equipment = CAT 627 Scraper

Tractor weight = 48,061 lbs

Scraper weight = 33,399 lbs

Soil load (20cy) = 48,000 lbs

Total weight = 129,460 lbs

Max weight per tire = 32,365 lbs assuming equal distribution

Tire width = 18 inches = 1.5 ft

Tire contact length = 4" = 0.33 ft

Tire contact area = $(18\text{")})(4\text{"}) = 72\text{ in}^2 = 0.5\text{ ft}^2$

$$w_{SD} = (c_s)(p)(F)(B_c)$$

$$w_{SD} = \text{Load on pipe (lbs/ft)}$$

 $p = \text{Intensity of distribution load (lbs/ft}^2)$ $F = \text{Impact factor}$ $B_c = \text{Outside diameter of pipe}$ $c_s = \text{Load coefficient}$

$$c_s = D/2H + M/2H$$

$$\frac{D}{2H} = \frac{1.5\text{ ft}}{(2(3\text{ ft}))} = 0.25$$

$$\frac{M}{2H} = \frac{0.33\text{ ft}}{(2(3\text{ ft}))} = 0.055$$

According to Table 4C.3 in the "Solid Waste Landfill Design Manual" published by Washington State Department of Ecology

$$c_s \approx 0.053$$

According to Table 4C.4 in the aforementioned reference, the impact factor for a 2 ft protective cover is the following

$$F = 1.2$$

$$w_{SD} = (0.053)(\frac{32,365\text{ lbs}}{(1.5\text{ ft})(.33\text{ ft})})(1.2)(0.55\text{ ft})$$

$$w_{SD} = 2,287\text{ lbs/ft} = 190\text{ lbs/in}$$

Static vertical load is greater than load due to equipment therefore those calculations govern.

Wall Crushing (Polyethylene Piping Systems Manual)

$$SA = \frac{(SDR-1)}{2} P_0 - \left(\frac{1-1}{2}\right)(182.4) = 910 \text{ psi}$$

SA = Actual compressive stress (psi)

P₀ = Total external pressure on top of pipe (psf)

Factor of Safety

According to "Polyethylene Piping Systems manual" the compressive yield strength of HDPE Pipe = 1,500 psi.

$$FS = \frac{1,500 \text{ psi}}{910 \text{ psi}} = 1.65$$

Equipment Loading

The equipment loading on HDPE Pipe is based on same assumptions used in PVC pipe calculation, therefore, static vertical load still govern HDPE pipe calculations.

Perforated PVC Pipe Load Summary

Forces Within Liner System

$$N = W \cos \beta = \text{Normal Force on liner} = (13,707 \text{ plf}) \cos(14.04) = 13,298 \text{ plf}$$

$$P = W \sin \beta = \text{Shearing Force on liner} = (13,707 \text{ plf}) \sin(14.04) = 3,325 \text{ plf}$$

$$\underline{N = 13,298 \text{ plf}} \quad \underline{P = 3,325 \text{ plf}}$$

Resistance in Protective Cover and Textured HOPE

$$F_1 = N \tan(\theta) + \frac{C_r(C_s)}{\cos \beta} = (13,298 \text{ plf}) \tan(32) + \frac{0(40)}{\cos 14.04} = \underline{8,310 \text{ plf} = F_1}$$

$F_1 > P$: the protective cover is stable

Resistance in Geocomposite and Textured HOPE

$$F_2 = (13,298 \text{ plf}) \tan(20.1) + \frac{(0)(40)}{\cos 14.04} = \underline{4,866 \text{ plf} = F_2}$$

$F_2 > P$: Geocomposite is stable

Resistance in Textured HOPE and GCL

$$F_3 = (13,298 \text{ plf}) \tan(27.3) + \frac{(0)(40)}{\cos 14.04} = \underline{6,864 \text{ plf} = F_3}$$

$F_3 > P$: Textured HOPE is stable

Resistance in GCL + Subgrade

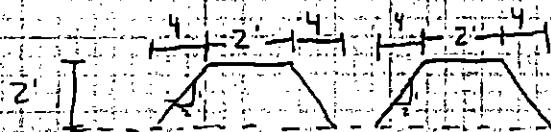

$$F_4 = (13,298 \text{ plf}) \tan(28.2) + \frac{(0)(40)}{\cos 14.04} = \underline{10,717 \text{ plf} = F_4}$$

$F_4 > P$: GCL is stable

Since all F (Resistance) Forces are greater than the shearing force, there is no tensile stress in the liner system

Tensile stress due to equipment loading

- Only protective cover is in place (z') = h_{soil}
- Max unsupported length of protective cover = 70' @ 4H:IV
- Unit weight of Soil = $110 \text{ lbs/ft}^3 = \gamma_s$
- Internal Friction angle of soil = $33^\circ = \phi$
- Critical Interface friction angle is between Geocomposite and Textured HDPE liner = $20.1^\circ = \delta$
- Use CAT D6N Dozer (Tier 4 Final / Stage V)
- Operating weight = $36,943 \text{ lbs}$
- 24" Track width
- Width acting on Geocomposite = 200 ft

Tensile forces acting on Geocomposite

$$F_{soil} = (h_{soil})(\text{unsupported slope length})(\gamma_s)(\sin \beta) \quad \beta = 14.04^\circ$$

$$= (2')(70)(110 \text{ pcf})(\sin 14.04) = F_{soil} = 3,736 \text{ lbs/ft}$$

$$F_{dozer} = \left(\frac{(\text{dozer weight})}{(\text{width acting on Geocomposite})} \right) \sin(\beta)$$

$$= \left(\frac{(36943 \text{ lbs})}{20.0'} \right) \sin(14.04) = F_{dozer} = 44.8 \text{ lbs/ft}$$

$$\text{Tensile forces on Geocomposite} = 3,736 \text{ lbs/ft} + 44.8 \text{ lbs/ft} = 4,184 \text{ lbs/ft}$$

Resistive forces on Geocomposite

$$F_{geo} = (\text{weight of soil} + \text{weight of dozer}) \cos \beta \sin \phi$$

$$F_{geo} = ((2')(70)(110 \text{ pcf}) + 36943 \text{ lbs}) \cos(14.04) \sin(20.1) = 1,293 \text{ lbs/ft} = F_{geo}$$

$$F_{butress} = \left[\frac{\cos \phi \theta}{\cos(\theta + \beta)} \right] \left[\frac{\gamma_s (h_{soil})^2}{\sin(2\beta)} \right] \tan(\theta) = \left[\frac{\cos(33)}{\cos(33 + 14.04)} \right] \left[\frac{(110)(2)^2}{\sin(28.08)} \right] \sin(33)$$

$$F_{butress} = [1.23] [934.77] [0.6494] = 743 \text{ lbs/ft} = F_{butress}$$

Continued on next page

Resistance Force in Geocomposite

$$\text{Resistance Force in Geocomposite} = F_{Geo} + F_{Bulwark}$$

$$\text{Resistance Force} = 11,293 \text{ lbs/ft} + 743 \text{ lbs/ft} = 12,036 \text{ lbs/ft}$$

Tensile Stress in Geocomposite

$$T_{Geo} = \text{Tensile stress in Geocomposite} = (F_{Soil} + F_{Dozer}) - \text{Resistance Forces}$$

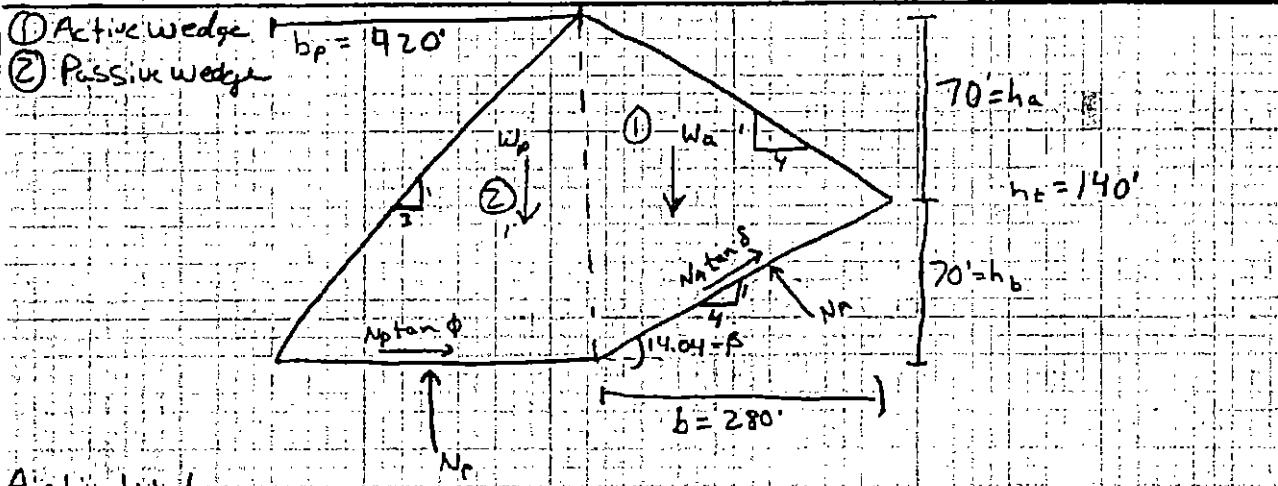

$$T_{Geo} = (3,736 \text{ lbs/ft} + 448 \text{ lbs/ft}) - 12,036 \text{ lbs/ft}$$

$$T_{Geo} = -7,852 \text{ lbs/ft}$$

Negative Tensile Stress indicates that Geocomposite is not in tension.

Translational Failure Analysis

Active Wedge

$$W_a = \frac{1}{2}((b)(h_a)(\gamma) + (b)(h_b)(\gamma))$$

W_a = Weight of Active Wedge (waste over side slope)

b = horizontal length of active wedge = 280'

h_a = height of final cover = 70'

h_b = Depth of cell = 70'

γ = unit weight of waste = 74pcf

$$W_a = \frac{1}{2}((280')(70')(74\text{pcf}) + (280')(70')(74\text{pcf}))$$

$$W_a = 1,450,400 \text{ lbs/ft}$$

Passive Wedge

$$W_p = \frac{1}{2}(b_p)(h_t)(\gamma)$$

W_p = weight of passive wedge

b_p = horizontal length of passive wedge = 420'

h_t = Height of wedge = 140'

γ = 74pcf

$$W_p = \frac{1}{2}(420')(140')(74\text{pcf}) = 2,175,600 \text{ lbs/ft}$$

$$W_T = W_a + W_p = 1,450,400 \text{ lbs/ft} + 2,175,600 \text{ lbs/ft}$$

$$W_T = 3,626,000 \text{ lbs/ft}$$

③ Excerpt from Waste Containment Systems, Waste Stabilization, and Landfills: Design and Evaluation

$$a = ((450,400)(\sin(14.04)) \cos(1.15) + (2,175,600)(\cos 14.04)(\sin 1.15))$$

$$a = 1394,155 \text{ lbs/ft}$$

$$b = ((450,400)\tan(10) + (2,175,600\tan(20.1)) + 3,626,000\tan(33)) \sin(14.04) \sin(1.15) \rightarrow$$

$$\rightarrow - (1,450,400 \tan(20.1)) + (2,175,600 \tan(10)) \cos(14.04) \cos(1.15)$$

$$b = 3406653 (0.004869) - 886893$$

$$b = 16,587 - 886893$$

$$b = -870,306 \text{ lbs/ft}$$

Continued on next page

$$C = -[3,626,000 \tan(33) (\sin(14.04) \cos(1.15) \tan(10) + \cos(4.04) \sin(1.15) \tan(20.1))] + >$$

$$\hookrightarrow (1,450,400 \cos(14.04) \sin(1.15) + 2,175,600 \sin(4.04) \cos(1.15)) \tan(20.1) \tan(10)$$

$$C = -[174,864 + 35,872.4]$$

$$C = -153,359 \text{ lbs/ft}$$

$$d = (3,626,000) \cos(4.04) \cos(1.15) \tan(20.1) \tan(10) \tan(33)$$

$$d = 147,375 \text{ lbs/ft}$$

So,

$$394,155 FS^3 - 870,306 FS^2 - 153,359 FS + 147,375 = 0$$

Now we solve for "FS" by trial and error using an Excel spreadsheet. Example calculations are shown below.

Assume FS = 1

$$394,155(1^3) - 870,306(1^2) - 153,359(1) + 147,375 = \underline{-4,821.35}$$

Assume FS = 2.31

$$394,155(2.31^3) - 870,306(2.31^2) - 153,359(2.31) + 147,375 = \underline{7,585}$$

Assume FS = 2.30

$$394,155(2.30^3) - 870,306(2.30^2) - 153,359(2.3) + 147,375 = \underline{-13,586}$$

Therefore the factor of safety is between 2.30 and 2.31

FS = 2.3 which indicates the waste is stable
