

Development of Other Irregular Sections in HPA Fruitland Coal

- Out of 400 possible infill locations, 18 infill wells have been drilled in non-standard spacing units (4.5% of total)¹
- Three of these wells resulted in average well spacing patterns smaller than the spacing pattern of KEC's current proposal
- All 18 development wells drilled in irregular sections resulted in a drilling pattern with four wells per section
- None of these locations required a special hearing
- The only difference between these locations and KEC's proposal is the originally defined spacing units
