

1 Q. Now, what would be -- maybe you could walk us  
2 through what a typical artesian phenomenon might sort of --

3 A. It probably -- if it's all right, I can talk  
4 about that when we talk about the proposed well completion for  
5 the oil and gas wells.

6 Q. Sure.

7 A. Just wanting to kind of lay the foundation for  
8 the artesian waters.

9 Q. Okay. This slide is titled Summary of Water  
10 Supply Well Depth and Water Levels.

11 A. These are some of the information of wells in the  
12 area, you know, over the Rio Brazos down into the TA Creek and  
13 around Tierra Amarilla. I got this right off the State  
14 Engineer's Waters Database web site. So all of these are water  
15 supply wells that they have records of. Of course, there's  
16 many more, as we talked about earlier.

17 But the thing -- what I did was I sorted them by well  
18 depth. And so you can -- some of them are as shallow as 10  
19 feet and then others are over 1,000. And this for a mutual  
20 domestic community water system. And those -- the reason why  
21 those wells are deep for that community water system is because  
22 they had to go to a more reliable source of water that was  
23 deeper.

24 And so there you can see there's a wide range of  
25 depths. And what I'm trying to say there is, water all down

1 through those depths is used for water supply -- or wells have  
2 been constructed at various depths throughout not only the  
3 alluvium, but the Mancos Shale and the Dakota Sandstone.

4 Q. Okay. Anything else on this slide?

5 A. Nope.

6 Q. This slide is titled Proposed Well Drilling  
7 Methods and Construction. What can you tell us about this  
8 slide?

9 A. Based on information from the four permits, as  
10 this is a similar table -- I have the AIP number, the name, the  
11 location, and the elevation, and then the proposed depth. And  
12 you can see there's three that are proposed for a 2,000 depth  
13 and one that goes to 6,000 feet.

14 And these are the way -- what's shown on the permit  
15 is that they are going to drill a 12 3/4-inch hole, I believe.  
16 I think that's a standard bit size. And then they're going to  
17 put in -- to 350 feet -- and then they're going to put in a 9  
18 5/8-inch casing -- or 7/8-inch casing -- almost a 10-inch  
19 casing, and then they're going to cement that in place, which  
20 is good.

21 But the issue I have with that proposed completion is  
22 that the annulus is not thick enough for an appropriate cement  
23 seal to protect upward flow of waters into another formation.

24 Q. And why is that? If you need to, we have a piece  
25 of paper and you could draw us a picture. But if you feel more

1 comfortable in describing why that's inadequate --

2 A. Well, if there's only an inch annulus, you're  
3 going to try to put a cement seal in over 350 feet. That's --  
4 and sometimes the hole is not perfectly straight. That casing  
5 will be --

6 MR. HALL: I think I'm going to interpose an  
7 objection at this point. He's not been qualified as a drilling  
8 engineer, well completion engineer.

9 MR. A. TRUJILLO: Mr. Finch, would you care to  
10 elaborate to Mr. Hall your experience in drilling?

11 THE WITNESS: Yes. I've been involved with hundreds,  
12 maybe even a thousand water supply wells across the State of  
13 New Mexico up to 5,000 feet in depth. And I've also assisted  
14 the City of El Paso with their \$2 million injection wells that  
15 were 4-5,000 feet in depth.

16 MR. HALL: Any casing or cementing programs?

17 THE WITNESS: Yes. Casing and cementing programs.

18 MR. HALL: For oil wells?

19 THE WITNESS: Pardon me?

20 MR. HALL: For oil wells?

21 THE WITNESS: Just for injection and water supply  
22 wells.

23 MR. BROOKS: Well, I'm going to overrule the  
24 objection. We'll allow the testimony for whatever benefit it  
25 has.

1           Q. (By Mr. A. Trujillo): Mr. Finch, will you finish  
2 letting us know what you feel is inadequate about the  
3 applications that Approach has submitted in terms of their  
4 casings?

5           A. If there are artesian conditions, the State  
6 Engineer will require a two-inch -- I think it's approximately  
7 two, two-and-a-half inch annulus for a water supply well for it  
8 to be a cemented surface casing. And all I'm saying is that  
9 these are not up to those standards for a water supply well for  
10 the same kind of conditions.

11          Q. And that is to prevent water from coming to the  
12 surface?

13          A. Right. That is to prevent commingling of  
14 aquifers. And also, if there's fresh water, you don't want it  
15 coming up and flowing out of the ground if it's artesian,  
16 because then you're wasting water. And one of the State  
17 Engineer's requirements for a water right is to conserve water.  
18 So it's contrary to conservation.

19          MR. BROOKS: I want to interject and ask a question  
20 because I didn't quite follow what you were saying. I thought  
21 you said -- and I had not seen the schematics for these  
22 permits -- but I thought you said that they were going to drill  
23 a 12 5/8-inch hole, correct?

24          THE WITNESS: It's a 12 1/4 or something like that.  
25 I have the numbers in my --

1 Q. (By Mr. A. Trujillo): Mr. Finch, why don't you  
2 refer to --

3 A. My technical memo?

4 Q. Either that or the application.

5 A. Right.

6 MR. BROOKS: The application should have schematics  
7 attached.

8 Q. (By Mr. A. Trujillo): Why don't we turn to  
9 Exhibit No. 4.

10 A. Is that the County's exhibit?

11 Q. County Exhibit No. 4.

12 A. Okay.

13 Q. Now, Mr. Finch, this is titled Application for  
14 Permit to Drill, Re-enter, Deepen, Plugback or Add a Zone, and  
15 it appears to have been submitted on the Sena property. Now,  
16 do you see the proposed casing and cement program on second  
17 half of this page?

18 A. I do. It's for the first entry for hole sizes,  
19 12 1/4-inch, and then there's a 9 5/8 casing. And then that  
20 says a setting depth of 320 feet.

21 MR. BROOKS: Okay. Now, do you know if that 9 5/8 is  
22 the outside diameter or inside diameter?

23 THE WITNESS: You know, it doesn't specify.

24 MR. BROOKS: If it were outside diameter, you would  
25 have somewhere close to 3-inch annulus, right?

1 MR. A. TRUJILLO: Mr. Hearing Examiner, I'm going to  
2 have to object to you testifying in this matter.

3 MR. BROOKS: I'm asking the witness questions.

4 MR. A. TRUJILLO: I believe you stated a fact to him.

5 MR. BROOKS: I posed a hypothetical. And I'm  
6 overruling your objection.

7 THE WITNESS: My understanding is it's a 3 inch.  
8 Essentially you divide that by two and that would be your --  
9 the actual annulus. Because you're looking at the space in a  
10 diameter setting. So if you have 12 1/4 inches, 9 and  
11 whatever, the total on either side combined is three inches.  
12 And you divide that by half and end up with an inch and a half.

13 MR. BROOKS: Thank you. You may continue.

14 Q. (By Mr. A. Trujillo): So what you're saying is  
15 that --

16 MR. HALL: I'm going to object. It's looks like  
17 we're about to start leading the witness.

18 MR. BROOKS: Well, you need to let the counselor ask  
19 the question before you object.

20 MR. A. TRUJILLO: You're objecting because I'm about  
21 to do something?

22 MR. HALL: Sorry.

23 Q. (By Mr. A. Trujillo): Now, Mr. Finch, what are  
24 you saying, then, in terms of the hole size as it relates to  
25 the casing size as listed on all of Approach's applications?

1 A. I believe they're all the same.

2 Q. Now, how does -- go through the -- let me see.

3 A. They were all the same. It says that in my  
4 technical memo, and that's what I got from the permits. Now,  
5 this is just for the four permits.

6 Q. Mr. Finch, do you have a calculator I can borrow?

7 A. No.

8 MR. A. TRUJILLO: Mr. Hearing Examiner, if you could  
9 just give me one minute.

10 Q. (By Mr. A. Trujillo): Mr. Finch, let's get to  
11 the bottom of this, then. Mr. Hearing Examiner hypothesized to  
12 you the inner diameter versus outer diameter. Could you maybe  
13 go through that analysis for us?

14 A. Well, casing, depending on what type of casing it  
15 has, has specifications for inner and outer diameter. And  
16 typically, in the water well industry, a 14-inch casing, that's  
17 the nominal -- which means it's approximate -- is the inner  
18 diameter and the outer diameter is larger because of how thick  
19 the steel material is. It could be 14 inches and 3/8 or  
20 something.

21 Q. Okay. Now, in terms of the hole size and the  
22 casing size, what did you base your calculations on in terms of  
23 the inner and outer diameter? Can you explain that for us?

24 A. I assumed that the hole size is the hole size.  
25 There's no inner or outer there.

1 Q. Right.

2 A. And that the casing was the outer diameter.  
3 What's specified on the permit is the outer diameter of the  
4 casing.

5 Q. Okay.

6 A. It doesn't say on the permit if the casing  
7 size -- if it's the inner diameter or the outer.

8 Q. Okay. Let's leave it at that. What else can you  
9 tell us about this slide?

10 A. Oh, I have a list of potential sources of waste  
11 and contaminants that can be associated with oil and gas  
12 drilling. And, you know, the OCD has made great strides with  
13 the new Pit Rule to contain a lot of these fluids and to  
14 protect the environment. But there are things outside of pits  
15 related to the operations of drilling, such as fuel and the  
16 equipment itself. You know, there's hydraulics related to the  
17 equipment, and service rigs and other types of things that can,  
18 you know -- you can have a malfunction or something happen and  
19 you can have a release.

20 So just the Pit Rule itself doesn't cover everything.  
21 There's things related to the operation that can also produce  
22 potential sources of waste and contaminants.

23 Q. Now, were you here for opening statements?

24 A. I believe I walked in on them.

25 Q. Were you here for Mr. Hall's opening statement?

1 A. No, I was not.

2 Q. Mr. Hall indicated that Approach has asked for  
3 closed-loop systems. Have you had an opportunity to examine  
4 the applications in any detail?

5 A. No, I have not seen the applications for the  
6 closed-loop systems. The permits and even some of the  
7 applications all implied -- or most all of them implied -- a  
8 synthetic liner, a pit with a synthetic liner of 6 to 12  
9 millimeters.

10 Q. Now, implied -- I want to be a little more clear  
11 there.

12 A. Well, they stated. That's what was marked on the  
13 permits.

14 Q. Well, if you could turn to Rio Arriba County  
15 Exhibit No. 2.

16 MR. A. TRUJILLO: At this time Your Honor --  
17 Mr. Hearing Examiner -- I would move for the admission of Rio  
18 Arriba County Exhibits 2 through 5.

19 MR. HALL: No objection.

20 MR. BROOKS: 2 through 5 are admitted.

21 [Applicant's Exhibits 2 through 5 are admitted into  
22 evidence.]

23 Q. (By Mr. A. Trujillo): Now, Mr. Finch, half way  
24 down the page there is a box that says "pit," and there is  
25 another little box that says "closed-loop system." Will you

1 please tell us which is checked?

2 A. Closed-loop system is not checked. And a pit  
3 with the synthetic liner is checked. And it says the liner  
4 will be 6 milliliters thick -- millimeters thick -- excuse  
5 me -- if I read that right.

6 Q. I believe it's 6 -- is it millimeters or is  
7 millionths of an inch?

8 A. I can't -- this has a -- I'm not sure what that  
9 stands for there.

10 Q. Am I --

11 A. It's hard to read on this. This is fuzzy. I'm  
12 not sure what the abbreviation is for.

13 Q. Let's go, then, to No. 3. And this is --  
14 Mr. Finch, just for the record, could you let us know what  
15 Exhibit No. 2, who that property owner was? It's at the top,  
16 property name?

17 A. Oh, Sulzemeier.

18 Q. Okay. And now No. 3, who is the property owner  
19 in this application?

20 A. Sena.

21 Q. Okay. And so this -- I'm sorry, Mr. Finch.  
22 Could you turn back one more time to No. 2? And in the bottom  
23 right-hand corner where it says Oil Conservation Division, do  
24 you see a signature?

25 A. I do.

1 Q. Does it indicate to you that this application has  
2 been approved?

3 A. It does.

4 Q. Now, let's turn to No. 3. Do you see a signature  
5 that indicates that application has been approved?

6 A. Yes.

7 Q. Now, is this application approved for a  
8 closed-loop system or for a pit?

9 A. For a pit.

10 Q. And how thick is the pit liner in that one?

11 A. Six -- whatever those units are.

12 Q. And the property name was?

13 A. Synthetic liner.

14 Q. No, the property owner was?

15 A. Sena.

16 Q. Let's go ahead and go to 4. At the bottom  
17 right-hand corner of No. 4, do you see a signature from the oil  
18 and gas -- the deputy oil and gas inspector?

19 A. I do.

20 Q. Now, is this application approved?

21 A. Yes.

22 Q. Now, is this application for a pit or a  
23 closed-loop system?

24 A. It's for a pit. But the thickness of the liner  
25 seems to be different.

1 Q. We won't even speculate what that says. Who is  
2 the property owner?

3 A. Sena.

4 Q. Okay. Now, let's go to No. 5.

5 A. Okay.

6 Q. Same thing, bottom right-hand corner. Is this  
7 application approved? Is there a signature?

8 A. There is.

9 Q. Now, is this application for a closed-loop system  
10 or for a pit?

11 A. For a pit.

12 Q. And who's the property owner here?

13 A. The Woolley family.

14 Q. Okay. Now, let's go to No. 6. Is this  
15 application approved?

16 A. It's not signed.

17 Q. Okay. So it's not approved, then?

18 A. It doesn't look like it.

19 Q. And this application for a pit liner or a  
20 closed-loop system.

21 A. For a closed-loop system.

22 Q. So we have one. Okay. Let's go to No. 7. Now,  
23 this application -- I'm sorry. Did you say the property owner  
24 name for No. 6?

25 A. The property owner is Sultemeier.

1 Q. So Sultemeier 2. Now, in Exhibit 7 -- now, this  
2 application, has this been approved?

3 A. No.

4 Q. And is this application for a closed-loop system  
5 or for a pit?

6 A. For a closed-loop system.

7 Q. For a closed-loop system. And this application,  
8 who's the property owner?

9 A. Trujillo.

10 Q. Were you here this morning when you heard  
11 Mr. Hall indicate that this closed-loop system application had  
12 been withdrawn?

13 A. Yes.

14 Q. Now, let's turn to No. 8. And is this  
15 application approved?

16 A. No.

17 Q. And is this application for a closed-loop system  
18 or a pit?

19 A. It's for a closed-loop system.

20 Q. All right, three. And who is the land owner in  
21 this application?

22 A. Roller.

23 Q. Roller?

24 A. I believe it says Roller.

25 Q. Okay. Now, let's got to No. 9. Is this

1 application approved?

2 A. No.

3 Q. Is this for a closed-loop system or a pit?

4 A. It looks like it's for a pit.

5 Q. For a pit, okay. And who's the application owner  
6 in this -- excuse me. Who is the owner of the property?

7 A. Hinkle.

8 Q. Hinkle? Now No. 10. Is this application  
9 approved?

10 A. Nope.

11 Q. And is this application for a closed-loop system  
12 or a pit?

13 A. Pit.

14 Q. Okay. And who is the applicant in this -- excuse  
15 me. Who is the property owner?

16 A. Garcia.

17 Q. And I believe this is the last one, No. 11. Is  
18 this application approved?

19 A. No.

20 Q. And is this application for a closed-loop system  
21 or a pit?

22 A. Pit.

23 Q. And who is the owner of this property?

24 A. Valdez.

25 Q. Now, Mr. Finch, how many closed-loop systems did

1 you see in these applications? Was it three?

2 A. Yeah. That seems about right, three or four.

3 There was fewer of those than there were pits, yes.

4 Q. And how many of those closed-loop systems were in  
5 granted permits?

6 A. None.

7 Q. Now, is there anything else about this slide that  
8 you'd like to discuss?

9 A. I think we've touch on all those points.

10 Q. Okay. And what is this slide? This slide is  
11 titled Rio Chama Region Water Plan. What is this slide?

12 A. Well, this is directly -- a map, Figure 13. It's  
13 a vegetation map out of the Rio Chama Water Plan. And the  
14 reason why I used it for this slide is because it has a nice, I  
15 guess, visual of the outline of the Rio Chama Watershed in that  
16 dashed line.

17 And then it has the Rio Chama and the tributaries  
18 labeled. And you can see TA Creek going into this purple area  
19 and the purple is conifer forest and more of the high mountain  
20 type of environment. That's -- the slide is really -- that's  
21 all I have to point out on that.

22 Q. Approximately where in this slide is the area  
23 where Approach Oil has placed applications to drill oil wells?

24 A. In the middle of the figure there's a purple --  
25 what do you call it -- blob.

1 Q. And what is that purple blob -- the legend, what  
2 is that purple blob --

3 A. It's subalpine conifer forest.

4 Q. Okay.

5 A. So most of the permit area is up in TA Creek in  
6 this purple area.

7 Q. Okay. Now, I see something in the left-hand  
8 side, "Recognizes the Importance of Water to the Communities."  
9 What is that referencing?

10 A. That's just a general statement. As part of my  
11 preparation for my testimony, I reviewed the Rio Chama Region  
12 Water Plan because these water plans are significant in  
13 reflecting what the community needs are for water and how  
14 they're going to ensure a reliable supply and quantity in the  
15 future.

16 Q. I see. Now, is there anything else in this  
17 slide?

18 A. No. And these next few slides are pieces of that  
19 water plan that I've taken right out of it. This is the  
20 summary of the Rio Chama Regional Water Plan planning  
21 alternatives. The plan is very comprehensive. It describes  
22 all the water resources, all the cultural aspects, it has  
23 public input, and then it becomes adopted by the Interstate  
24 Stream Commission.

25 And two things that are important here is that we

1 have one, it says protect water quality, and then protect and  
2 restore upper watershed areas. Those are the last bullet and  
3 the third to last bullet.

4 Oh -- also, at the very top it says, "Preserve the  
5 Acequia System and Strengthen its Role in Community Life."  
6 These are all -- these were stated in the water plan numerous  
7 times and it's the common theme.

8 Q. When was this Rio Chama Regional Water Plan  
9 enacted?

10 A. There were several drafts that were done  
11 starting -- I can't remember when it started -- but I believe  
12 the final plan was adopted and published and put on the  
13 Interstate Stream Commission web site a couple of years ago.

14 Q. Okay.

15 A. That's all I have for this one.

16 Q. Can you go ahead and just read some of those  
17 bullets into the record? You can skip the ones you've already  
18 read.

19 A. Okay. "Develop local agriculture with  
20 information, marketing and financial support. Provide reliable  
21 water supplies to community water systems. Conserve and reuse  
22 water resources where appropriate. Protect water quality.  
23 Protect and restore upper watershed areas," with an emphasis on  
24 upper.

25 Q. Okay. Now, this next slide is entitled Rio Chama

1 Water Plan.

2 A. Right. And I apologize for the wording, but it's  
3 the basic strategy that came out of water plan for protecting  
4 the supplies. And the strategy is to regulate and discourage  
5 development in upper watershed areas.

6 And I'll just read it, if that's all right.

7 Q. That's fine.

8 A. "The upper reaches of the Rio Chama mainstem and  
9 tributary watersheds are sensitive areas and need to be  
10 carefully managed. Land practices in these upper reaches have  
11 large impacts on the quality and quantity of water that reaches  
12 the streams and acequias within the entire watershed. There is  
13 general agreement in the region to restrict or even prohibit  
14 the development in these areas. If the development is allowed,  
15 it is very important to stringently regulate road design,  
16 implement runoff catchment structures, require terrain  
17 management to prevent excessive runoff, and re-vegetate all  
18 disturbed areas.

19 "Re-vegetation and erosion control requirements  
20 should be stringently enforced in all instances of disturbance  
21 including non-construction activities such as utility  
22 installation or logging. Adequate road construction standards  
23 are important here, as everywhere. In most upper watershed  
24 areas, we need to preserve the ability to use fire as a  
25 watershed management tool to maintain forest health and

1 watershed productivity without fear of damaging inappropriately  
2 stilted structures. This would tend to argue for prohibiting  
3 any development in these areas."

4 MR. BROOKS: I believe that said, "inappropriately  
5 sited structures," doesn't it?

6 A. Oh, sited. Thank you.

7 Q. (By Mr. A. Trujillo): Okay. I'm not sure if I  
8 want you to read this one.

9 A. I don't want to do that either. I'm just going  
10 to say that over in the right-hand column, starting in the  
11 seconds paragraph, the second sentence, there are  
12 recommendations on protecting and restoring the watersheds for  
13 not only the higher altitude areas, but also the low altitude  
14 areas. And they're very specific here. And this is based on  
15 all the details and information that were compiled in that  
16 water plan.

17 Q. Okay. Now --

18 A. That's it. We can go to the next one.

19 Q. Now, this seems to be a continuation of the Rio  
20 Chama Water Plan.

21 A. It is. The next slide is as well. And there's  
22 one -- I thought an important thing here mentioned in the plan  
23 is how this all gets implemented.

24 Q. Now, where do you find that information?

25 A. Directly out of the water plan.

1 Q. On this slide, where do you find that  
2 information?

3 A. Under implementation.

4 Q. Go ahead and read that for us, then.

5 A. Yeah. I'll just read the first paragraph. The  
6 second is not --

7 "Implementation of land use restrictions generally  
8 falls to county administration in our region, since no other  
9 government entity has jurisdiction except in the village of  
10 Chama, our only municipality, and the Jicarilla Apache Tribe.  
11 County staff would need to draw up an ordinance to be enacted  
12 by the county commission and the county would need to assume  
13 responsibility and allocate funding for enforcement."

14 Q. Next slide? Now, actually, before we go to your  
15 conclusions, let's go to your memorandum, Steve.

16 A. Okay.

17 Q. And I believe that is Exhibit 20 -- no, 19. I'm  
18 sorry. Mr. Finch, in going over this, there was a question --  
19 there was a clarification -- or at least I wanted you to maybe  
20 help me understand what this term meant. And it's found on  
21 Page 3, one, two, three, four -- paragraph four.

22 And I'll just read it for you and you can explain it  
23 to me. "The shallow alluvium is recharged by surface water and  
24 is in direct communication."

25 Now, what does "direct communication" mean?

1           A. That means the surface water and the shallow  
2 ground water in those alluvium deposits interact. So  
3 there's -- the water will infiltrate, the surface water will  
4 infiltrate into the alluvium readily. In places the alluvium  
5 may discharge out as surface water downstream, maybe even in  
6 the form of a spring.

7           So they're -- they are inter-related. So if you  
8 pollute the surface water, you pollute any shallow alluvial  
9 groundwater downstream of it.

10          Q. Well, then, read the first sentence of that  
11 paragraph in context with what you just said?

12          A. "Water supply wells in the vicinity primarily  
13 yield ground water from shallow alluvium."

14          Q. What that means is that the water wells are in  
15 communication with the surface water in these wells?

16          A. Right.

17          Q. And is that --

18          A. Where those deposits are saturated with  
19 groundwater.

20          Q. And that's here in this area where these oil  
21 wells --

22          A. I've described them in most of the major valleys  
23 and arroyos, the alluvial deposits in the bottoms where they  
24 are, there's shallow groundwater.

25          Q. Okay.

1 MR. A. TRUJILLO: I pass the witness.

2 MR. BROOKS: Very good. At this point, let us take  
3 a --

4 MR. A. TRUJILLO: I'm sorry. I'm sorry. Mr. Finch  
5 has not concluded his -- I apologize.

6 MR. BROOKS: All right. Yes, I thought you probably  
7 would want to get --

8 A. I'll just go through them quick.

9 Q. (By Mr. A. Trujillo): No, no. Don't go through  
10 them quick. I'm sorry.

11 A. They're very simple.

12 Q. What are your conclusions, then, of this  
13 preliminary analysis of the applications to permit and granted  
14 permits for oil wells in this Rio Chama watershed?

15 A. These are my opinions based on analysis that I  
16 presented here. And, you know, the Rio Chama Regional Water  
17 Plan is a very strong, convincing document for protecting those  
18 upper watershed areas. And I think that should be considered.  
19 That is no different than what the Forest Service is doing  
20 right here in Santa Fe where they have a municipal watershed  
21 that's protected from any kind of development. As a matter of  
22 fact, people can't even hike in there. Maybe it doesn't need  
23 to be that stringent, but there's examples of where this kind  
24 of thing takes place, this level of protection for surface and  
25 groundwater. And the water plan is the basis for all of that.

1           The second bullet is -- I really think you need for  
2   these permits on these, or these applications, a well siting  
3   analysis needs to go along with it before the permit is issued.  
4   And this should be a field investigation as well as looking at  
5   existing information. Mainly, for this area where we have such  
6   a viable resource of water as in the Rio Chama watershed.

7           And then if you're going to do anything -- drill --  
8   use only closed-loop systems. I think that's becoming -- with  
9   the new Pit Rule, that's already in place.

10          The last bullet item is to -- I think the OCD may  
11   want to consider requiring a better annular seal for the  
12   surface casing for these wells to prevent upward migration of  
13   saline water or commingling of aquifers. And that would help  
14   protect the groundwater.

15          Q. Now, Mr. Finch, in terms of the second bullet  
16   point, would those then be individual hydrologic well siting  
17   evaluations before issuing drill permits?

18          A. Yeah. Because you don't want to do it after the  
19   fact. I think that's what happened at Sultemeier No. 1.

20          Q. And what do you mean "after the fact"?

21          A. Well, I mean, before you even build a pad or do  
22   anything, you need to look at where you're going to put it.  
23   And maybe that well would have been found, and you would have  
24   known that you were -- whatever it is -- 50 feet from an  
25   existing water supply well.

1 MR. A. TRUJILLO: I pass the witness.

2 MR. BROOKS: Okay. Let us take a 15-minute recess.

3 [Recess taken from 3:28 p.m. to 3:45 p.m., and  
4 testimony continued as follows:]

5 MR. BROOKS: Okay. We'll go back on the record. We,  
6 according to my calculations, Rio Arriba County has remaining  
7 2 hours, 22 minutes, and Approach has remaining 5 hours, 26  
8 minutes. That's a total of 7:48, of course, because I would  
9 like to get at least halfway through with the allotted  
10 testimonial time today. We'll need a little over an hour and a  
11 half to do that. We'll need close to two hours to do that. So  
12 I would like to go to about 5:30 this afternoon. Does that  
13 create a hardship for anyone?

14 MR. HALL: No.

15 MR. A. TRUJILLO: No.

16 MR. BROOKS: Okay. Very good. Mr. Hall, you may  
17 cross-examine.

18 MR. HALL: Thank you, Mr. Examiner.

19 CROSS-EXAMINATION

20 BY MR. HALL:

21 Q. First, Mr. Finch, let me address your Exhibit 19,  
22 you're technical memorandum, if you have that in front of you.

23 A. I do.

24 Q. As I understand it, the only difference between  
25 what was contained in the exhibit notebook and what was handed

1 out here today was the date only; is that correct?

2 A. Yeah. Just the date on the first page.

3 Q. Okay. On the second page of your technical  
4 memorandum, you created the maps, is that right, from Topo  
5 Resources?

6 A. And my staff helped me as well, on some of these.

7 Q. Did you locate any of the previously existing oil  
8 and gas well bores on this here?

9 A. No, I did not.

10 Q. Did you know that any existed?

11 A. I know that there are some in this are, in the  
12 county.

13 Q. In the vicinity of your map area?

14 A. I do not know where they are in relation to this  
15 map.

16 Q. Okay. Did you check to see if there were any?

17 A. I did not.

18 Q. Would that have any bearing on your conclusions  
19 at all?

20 A. Well, any additional information may have some  
21 bearing on my conclusions.

22 Q. Okay. Page 3 of your technical memorandum, you  
23 list the number of designated uses by the Water Quality Control  
24 Commission. Do any of those designations result in the  
25 restriction of the siting of any of the facilities of any kind?

1 A. Pardon me? I didn't quite --

2 Q. Page 3 of your technical memorandum.

3 A. Right.

4 Q. There are a number of designations you have  
5 listed there.

6 A. That's correct.

7 Q. Pursuant to the Water Quality Control Commission  
8 designations. Do you see that?

9 A. Yes, I do.

10 Q. Do any of those designations restrict the  
11 construction of facilities in those designated areas,  
12 facilities of any type?

13 A. These aren't areas for designated uses.

14 Q. Do those designations restrict construction of  
15 surface facilities of any kind?

16 A. I guess I believe there are many agencies -- and  
17 this maybe a better question for your expert -- but there are  
18 many agencies that adopt these standards set by the New Mexico  
19 Water Quality Control Commission, and they use those standards  
20 too in their permitting process. So there may be, I'm just  
21 familiar with --

22 Q. You're not aware?

23 A. I'm not aware of all the details of every agency  
24 that uses these standards.

25 Q. You're not aware whether those act as

1 restrictions, then, on surface use?

2 A. No, I'm not aware of it.

3 Q. Okay. And I notice on Page 7 of your report, it  
4 says in the very first sentence, "Depth to groundwater for each  
5 NMOCD well permit location cannot be determined without  
6 site-specific data."

7 You didn't visit the well sites, did you?

8 A. No, I did not.

9 Q. Are you aware of whether any of the staff of the  
10 OCD visited any of these well sites in reviewing the permit  
11 application?

12 A. There's nothing on the permits or the  
13 applications that would indicate there was a site visit. My  
14 information is purely based on those permits and applications.

15 Q. So the answer to my question is, no, you don't  
16 know if there were?

17 A. I'm not aware of anything.

18 Q. Your Exhibits 2 through 12 that we ran through,  
19 the drilling permits and APDs, you're familiar with that  
20 terminology?

21 A. Exhibits 2 through 12. Yeah, I remember all  
22 that.

23 Q. You don't need to refer to them, but let me ask  
24 you, do you know whether Exhibits 2 through 12 are complete.  
25 Are there any more regulatory filings associated with these

1 exhibits?

2 A. One thing I did look for is if there's any  
3 conditions of approval. I never saw where that box was checked  
4 under the OCD Division. And since there wasn't a closed-loop  
5 system, I never saw an application related to these permits.

6 Q. Okay.

7 A. So this is all I'm aware of in relation to these  
8 permits or applications.

9 Q. Okay. So you don't know whether these are  
10 complete; is that correct?

11 A. Well, if it's been signed and approved, I would  
12 say that it should be complete.

13 Q. What's a C-144?

14 A. I'm not intimately familiar with the forms and  
15 titles of forms for at least all of them, for the OCD.

16 Q. All right. Are you familiar with the permit  
17 application for pits that the Division is now using?

18 A. The new Pit Rule?

19 Q. Yes, sir.

20 A. I have some familiarity with it, yeah.

21 Q. Are you familiar with the form?

22 A. I'm not familiar with the form.

23 Q. Okay. Now, I get to ask you about your casing  
24 and cementing design experience. I'm interested to know about  
25 the 5,000-foot water well you drilled. Where was that?

1 A. That was in the San Juan Basin.

2 Q. Was that drilled with fluids; do you recall?

3 A. I don't recall. It could have been air, but I  
4 don't remember.

5 Q. Were you just involved in the design of the  
6 casing and cementing program for that well?

7 A. No. I'm a geologist. We don't design. We  
8 specify.

9 Q. Were you involved in creating those specs.

10 A. We work with engineers and we provide  
11 specifications.

12 Q. Okay. Do you know what type of cement was used  
13 for that particular drill?

14 A. I don't recall.

15 Q. Do you know what -- you don't know about the  
16 compressibility or the mix?

17 A. No. That was probably 20 years ago.

18 Q. You don't know the injection rates?

19 A. No, I don't.

20 Q. Is the rate of injecting cement a concern when  
21 you're drilling through water bearing aquifers?

22 A. Rate of injecting cement? Usually when we're  
23 drilling in aquifers, we don't inject cement or --

24 Q. It's the pumping rate.

25 A. I don't understand your question.

1 Q. You don't know?

2 A. No, I don't know what your question is.

3 MR. A. TRUJILLO: I'm going to object. I don't  
4 recall hearing a question, either.

5 MR. BROOKS: Well, I think that the witness was in  
6 the middle of an answer and Mr. Hall went on to another  
7 question and then this conversation arose. So I suggest we  
8 proceed to the next question.

9 UNIDENTIFIED PUBLIC MEMBER: Mr. Hearing Officer?

10 MR. BROOKS: Yes?

11 UNIDENTIFIED PUBLIC MEMBER: Would you have people  
12 speak up a little louder? Because it doesn't make it back here  
13 as far as being able to hear. I would appreciate that.

14 MR. BROOKS: Okay. I shall endeavor to do so, and  
15 hopefully others will also. Go ahead.

16 Q. (By Mr. Hall): As far as you know, can you tell  
17 us whether the casing and cementing program proposed by  
18 Approach for its wells complies with the OCD's casing and  
19 cementing and drilling requirements?

20 A. I don't know. All I know is that these four  
21 permits were approved as they are written here.

22 Q. Okay. Could we go to your slides, please, sir?  
23 I have some questions about them. Your fourth slide was the  
24 boundary map for the headwaters of the Rio Chama?

25 MR. A. TRUJILLO: I'm sorry, Mr. Hall. I didn't

1 catch that. Is this the --

2 MR. HALL: This is the right one.

3 Q. (By Mr. Hall): The boundary for the entire  
4 watershed is depicted by the hatch line, correct?

5 A. That's correct, yes, of the Rio Chama. It's also  
6 the planning boundary for the Rio Chama Regional Water Plan.

7 Q. Okay. How was that line determined? Is that a  
8 function of elevation?

9 A. It relates to drainage divides. Not necessarily  
10 elevation, but elevation does play a role.

11 Q. And so the Rio Chama Watershed itself includes  
12 lands to the west of the Rio Chama, of course?

13 A. That's correct.

14 Q. And are there oil fields located in that portion  
15 of the watershed?

16 A. I know there are some out west, but I don't know  
17 where they are in proximity to the watershed boundary.

18 Q. Are you familiar with the El Poso field?

19 A. No.

20 Q. On the immediate west side of El Vado Reservoir.  
21 Have you seen that?

22 A. No, I have not.

23 Q. Are you familiar with the east and west Puerto  
24 Chiquito Mancos fields?

25 A. I'm not familiar with -- I may be familiar with

1     them in the sense of a location and a map, but not by a name.

2             Q.   Do you believe that the drilling protocol you're  
3     recommending in this case for the Approach wells also ought to  
4     apply to wells drilled in the west side of the watershed?

5             A.   No.   I differentiate the west side from the east  
6     side of the Rio Chama, that is.   And in my testimony I noted  
7     that the west side of the Rio Chama has an insignificant amount  
8     of surface water as compared to the east side.   And I was  
9     trying to draw that distinction because there is that  
10    distinction.   And that's why the east side is more important  
11    from a watershed protection standpoint than what you would see  
12    on the west side.

13            Q.   All right.   But there are still surface flows  
14    into the Rio Chama from the west side of the watershed?

15            A.   There are some.   And some of them even have  
16    individual stream standards that are different than what I have  
17    in my Table 2 of Exhibit 19.   Am I right?

18            Q.   That's your next slide, right?   The stream  
19    standards?

20            A.   Yes.

21            Q.   Could we get to that, please?   This is  
22    tributaries above El Vado, correct?

23            A.   Right.

24            Q.   East and west sides?

25            A.   There are -- like I said, I believe they are

1 below El Vado, but there are some tributaries from the west  
2 that have different standards, and I believe them to be below  
3 the El Vado Reservoir.

4 Q. Is it fair to say that summary recommendation in  
5 your report is that we got to do closed-loop drilling for these  
6 wells? Refer to Page 8 of your report, if you like.

7 A. Right. That's one of the recommendations.

8 Q. Okay. And are you recommending that protocol for  
9 wells drilled on the west side of the Chama Watershed as well?

10 A. I think it's a site-specific analysis. That's  
11 the other thing that the proposed Pit Rule -- or not proposed  
12 anymore -- the Pit Rule spells out is that you have to do a  
13 site analysis. And so you can't just say this region or that  
14 region. That's what gets you in trouble. If you're going to  
15 do it right, you have to go out to each individual site that  
16 you're looking at to see if you comply with the Pit Rule, and  
17 if you need a closed-loop system or not.

18 Q. And so you are recommending site evaluations for  
19 all watersheds in Rio Arriba County, then?

20 A. I think it would be a good practice for the  
21 entire State of New Mexico for the OCD to implement rather than  
22 be specific, because we have other areas that may come up like  
23 the Gila Wilderness area or over by Raton that might have  
24 similar characteristics.

25 Q. Are you satisfied with the siting protocol that's

1    been followed for the drilling of wells in the San Juan River  
2    Watershed in the western portion of the county?

3           A.   I'm not familiar with the processes for siting of  
4    wells in that area.  I believe they may differ between what  
5    types of wells they are and other conditions.

6           Q.   Can we go to your slides, please.  It's Figures 2  
7    and 3, the aerial photographs of the well site?  Where were  
8    these photographs obtained from?

9           A.   Google Earth.

10          Q.   I'm sorry?

11          A.   Google Earth.  It's an online network of aerial  
12    photography that you can --

13          Q.   I'm familiar with it.  I just wanted to know the  
14    source.  But you have not visited this location; is that right?

15          A.   That is correct.  I've been there before, but not  
16    when -- I've driven through there and been mountain biking in  
17    that area, but I haven't been there to see the well sites.

18          Q.   And you indicated that you thought there might be  
19    some surface water in the vicinity, ponds?

20          A.   Based on my experience and familiarity with that  
21    type of terrain, where that is, and also the detailed study we  
22    did a few miles north on the other side of the Rio Brazos, I  
23    know what those features are and what they represent and how  
24    the hydrology of the system works.

25          And so, yeah, based on my experience, those are

1 wetlands or, you know, headwaters, so to speak, areas that are  
2 seasonally saturated and ponded.

3 Q. Do you have any way of knowing when this  
4 photograph was taken?

5 A. No. I mentioned I didn't know what the month  
6 was, but it was obviously after the snow had melted -- sometime  
7 thereafter. It tells you -- Google Earth gives you a year,  
8 which is 2003. But it doesn't tell you the exact month or day.

9 Q. No springs are evident on that photograph?

10 A. There could be springs all over that place. That  
11 was one thing in the Rio Rancho study -- the Rancho Lobo -- was  
12 that we found not only a year round spring, but seasonal  
13 springs.

14 Q. Could we go to the next slide, please? This  
15 slide here, Figure 3, an aerial photograph showing the  
16 Sultemeier 1, Sena 1 and Sena 2 permit location and you  
17 describe these features in the lower left-hand quadrant as  
18 drainages. Is there any significance to that term, drainage?  
19 Is that a regulatory term?

20 A. It could be. I use it as a hydrologist. But  
21 each division within the state government has their own list of  
22 definitions. I'm sure one of them has it.

23 Q. Do you know what the Division's definition of  
24 water course is?

25 A. Which division?

1 Q. Oil Conservation?

2 A. No, I do not. I've looked at it, but I don't  
3 recall what it says specifically without having it in front of  
4 me.

5 Q. Okay. Would you call these arroyos. They're not  
6 water courses, are they?

7 A. Pardon me?

8 Q. Would you call these arroyos?

9 A. You could. I'm sure some people call them  
10 arroyos. You can call them -- some are perennial streams, some  
11 are ephemeral. There's a -- water course has a broad  
12 definition in my book. The Environment Department has even a  
13 broader definition.

14 Q. Okay. Let's look at the next slide, please. I  
15 want to know a little bit more about this. It's labeled  
16 "Groundwater Resources." That an accurate label for this?

17 A. No. It's a geologic map. But that's a title to  
18 key me in for what I was getting ready to talk about next.

19 Q. Okay. It's a bedrock geology map?

20 A. It's a bedrock geology map.

21 Q. It's not a soils map?

22 A. It does not have soils. It has some, you know  
23 quaternary deposits, but not all, because it's from the state  
24 geologic map which is a more regional mapping composite.

25 Q. Okay. Could we go to the next slide, please,

1 your cross section? Can you locate this cross section for us  
2 on, say, Exhibit 1? Do you know where the prime line is for  
3 that?

4 A. I know it's east to west through Tierra Amarilla,  
5 in that general vicinity. But I don't know if it's north or  
6 south. Tierra Amarilla is right in here. So it could be  
7 anywhere in this zone in our area of interest. The best way to  
8 check would be to look at the reference. It says, I think,  
9 from Doney, 1968.

10 Q. You pulled this out of the literature. Was there  
11 a reference to its location?

12 A. I pulled this out of the Rio Chama Regional Water  
13 Plan.

14 Q. Okay. Let's look at the next slide, please.  
15 This is your water supply well spreadsheet. Why did you select  
16 these wells in these locations?

17 A. I didn't. That's what the State Engineer's  
18 Waters Database provided me. When you search the Waters  
19 Database, you can look based on township range, or you can go  
20 through various other means and it'll -- sometimes it'll pop up  
21 different sets of wells. But this is what that particular  
22 search gave me.

23 Q. Was there just no available data for 28 North?

24 A. There was no available data for 28 North. That's  
25 correct.

1 Q. Tell us how you searched the database.

2 A. By township range.

3 Q. You searched all townships north and south of 28  
4 North?

5 A. Right. Including 28 North.

6 Q. Go to your next slide, please. The text in  
7 yellow, is this yours?

8 A. Yes.

9 Q. Your discussion of fluids there, are these fluids  
10 that you would find at any drilling location?

11 A. Not necessarily.

12 Q. You wouldn't find fuels and oils for drilling  
13 rigs and equipment?

14 A. Yeah, you would.

15 Q. Okay. What wouldn't you find, typically?

16 A. For what?

17 Q. You said "not necessarily." Which of these would  
18 you not find at a drilling location?

19 A. Well, the drilling fluids and additives, there  
20 are various, you know, kinds for the oil and gas industry, and  
21 then there's a whole other set for the water well industry.  
22 And the water well industry usually has what they call AWWA  
23 approved additives for drilling fluids which are specifically  
24 for water wells to protect the water, the groundwater from  
25 contamination. I have no idea if that's what the oil and gas

1 industry uses or would propose to use for those sites or not.

2 Q. You mentioned the importance of controlling  
3 erosion to prevent discharges into groundwater -- surface  
4 water, rather, the acequias and rivers. Is it possible to  
5 design and construct conduits so that erosion is mitigated or  
6 prevented?

7 A. Well, there's two ways to do it. I mean, one is  
8 to not even take the risk. That's probably the most  
9 preventative measure.

10 Q. My question is: Is it possible to design and  
11 build conduits and berms under structures to divert erosion?

12 A. You can limit your risk through design, but you  
13 don't rule them completely out.

14 Q. Are you familiar with the Division's guidelines  
15 for best practices for the abatement and prevention of waste?

16 A. I have limited familiarity with some of that,  
17 yes.

18 Q. All right. Do you know enough to recommend to  
19 the Examiner whether those best practices ought to be followed  
20 by Approach in drilling these wells?

21 A. I would think any best practices that limit the  
22 risk would be recommended.

23 Q. Say again? I didn't hear you.

24 A. My opinion is that any best practices that limit  
25 the risk for disturbing area, minimizing your footprint, and

1 disrupting water quality and flow would be recommended.

2 Q. Okay. The last page of your memorandum, Page 8  
3 there, is it fair to say that what you've said here is that you  
4 perceive the greatest risk for contamination is from pit  
5 fluids?

6 A. No. That's a risk, but I think the greatest risk  
7 is from not just these 10 wells, but the potential for  
8 development of numerous wells on a 40 grid spacing plus  
9 everything else that would follow.

10 Q. And you are speculating about 40 acres.

11 A. Yeah. Whatever the pattern would be based on a  
12 discovery and the OCD regulations, if there was a discovery.

13 Q. Do you know enough about the geology of the area  
14 to anticipate what likely drilling density might be in the  
15 area?

16 A. I don't know, but I know enough to realize that  
17 you would likely be targeting some of the same formations or  
18 adjacent formations that fresh water supplies are found. And  
19 that it is possible that oil or gas wells may need to be doing  
20 some type of hydrofrac procedure to get production, which may  
21 not be the best thing to do there. Those are some of the  
22 things that are off the top of my head.

23 Q. For the nine wells that are the subject of this  
24 proceeding, in your opinion, is closed-loop drilling indicated?

25 A. That's one of them. If you find a place that's

1 appropriate as far as a site goes, and then closed-loop system  
2 would be the next thing to follow.

3 Q. And if closed-loop drilling is utilized, will the  
4 need for the construction and use pits be obviated?

5 A. I'm sorry. I didn't catch that last part.

6 Q. If closed-loop drilling is utilized, will the  
7 need for the construction and use of pits be obviated?

8 A. Yeah. Except for the one that's already there at  
9 the Sulzemeier No. 1.

10 Q. It's not been used, has it?

11 A. I don't know. It's got fluid in it and I don't  
12 know what it's from.

13 Q. Did you sample the fluid?

14 A. No, I did not.

15 Q. Do you have reason to believe that it's anything  
16 other than rain water?

17 A. I have no idea.

18 Q. Okay.

19 A. I've seen on the photos that there is a pit  
20 there.

21 Q. Yeah. There's been no well drilled there, right?

22 A. It looks like there's surface casing or something  
23 like that and a culvert in place.

24 MR. HALL: That concludes my cross, Mr. Examiner.

25 MR. BROOKS: Okay. Do you have redirect?

1 MR. A. TRUJILLO: Yes, I do.

2 MR. BROOKS: Okay.

3 REDIRECT EXAMINATION

4 BY MR. A. TRUJILLO:

5 Q. Now, Mr. Finch, in your experience with water  
6 well drilling, let's talk about those casing and sealing  
7 requirements they have. Approach has submitted applications --  
8 10 applications -- that carry 12 1/4-inch casing -- 12 1/4  
9 holes -- excuse me -- with 9 5/8 casing. Do you agree?

10 A. That's what it says on the permits.

11 Q. Now, you previously testified that that is  
12 inadequate.

13 A. I believe it's inadequate.

14 Q. Now, in your experience as a water well driller,  
15 would those wells past muster or would the casing of these  
16 wells past muster?

17 A. Well, my main concern -- I guess the answer is  
18 no. And the reason why is my main concern is, that you are  
19 drilling through shales with air, which you're likely using  
20 some type of water and foam or something. That's what they  
21 propose is air. They may have to go to mud eventually in the  
22 Mancos. But you'll get some swelling so your hole diameter in  
23 places will be less than this 12 1/4. And, I mean, getting a  
24 seal to -- an appropriate seal -- I don't even know if a bond  
25 log would pick up all that, but --

1 Q. You don't know that what?

2 A. There's a method of determining if you have a  
3 good seal. It's called a bond log.

4 Q. Okay. What's a bond log?

5 A. It looks back in behind the casing to see if you  
6 have cement, in simple terms.

7 Q. Okay.

8 A. And so I would have to be convinced that this  
9 would have an adequate seal through some kind of demonstration  
10 like that.

11 Q. Okay.

12 A. I don't believe it's a big enough annulus to have  
13 an appropriate seal through this type of formation and drilling  
14 method.

15 Q. In water well drilling, are there specific  
16 specifications for these annular seals?

17 A. There are, especially for artesian wells.

18 Q. Okay. And what are those specifications?

19 A. I know it's greater than two-and-a-half inches.  
20 The State Engineer on their website has a manual for drilling  
21 construction of water supply wells. Without having that in  
22 front of me, I can't tell you all the details, you know, it's  
23 very specific.

24 Q. What is the annular seal here, if you can tell us  
25 that?

1 A. It's less than an inch and a half.

2 Q. And you mentioned the State Engineer has their  
3 standards for water well drilling. Are they greater or less  
4 than an inch and a half?

5 A. It's greater than two inches.

6 Q. Okay. I'm going to hand you -- these are the Oil  
7 Conservation Division's rules and regulations. And Mr. Hall,  
8 we'll be referring to Regulation 19.3 -- excuse me --  
9 19.15.3.106, sealing off strata, and 19.15.3.107, casing and  
10 tubing requirements.

11 Now, Mr. Finch, I want you to look through those  
12 briefly and tell us if you see an numerical standard for oil  
13 well drilling in the OCD regulations.

14 A. I don't see any annular space requirements, if  
15 that's what you're after.

16 Q. I want to know if there's a -- you have the State  
17 Engineer regulations here for drilling a water well and you  
18 have the Oil Conservation Division's regulation for drilling an  
19 oil well. Now, the State Engineer regulations say you have an  
20 annular seal of at least two and a half inches to prevent water  
21 from coming to the ground. Does the Oil Conservation Division  
22 have a similar numerical standard to prevent Mancos Shale, oil,  
23 produced water, or anything else from coming up to the ground?

24 A. No. The only thing here it says it shall be  
25 adequately protected by methods approved by the Division.

1 Q. Say that a little louder. Adequately --

2 A. "All fresh waters and waters present of potable  
3 value for domestic, commercial, or stock purposes, shall be  
4 confined to their respective strata and shall be adequately  
5 protected by methods approved by the Division."

6 And then it says, "Special precautions by methods  
7 satisfactory to the Division shall be taken and drilling  
8 abandonment wells to guard against any loss of artesian water."  
9 And then it goes on.

10 Q. So --

11 A. It's up to the OCD to -- it's like a  
12 discretionary thing, is what it seems like to me. But I don't  
13 know if they have -- they may have their own, if not in the  
14 regs, but they may have their own -- what do you call it --  
15 guidelines that aren't specified in these regulations.

16 Q. So they have further guidelines?

17 A. They could. It's not spelled out in these -- in  
18 this document here, but they could have their own guidelines  
19 that I'm not aware of.

20 Q. Now, Mr. Finch, in your opinion, then, are the  
21 Oil Conservation Division regulations as applied to annular  
22 seal requirements inadequate?

23 A. You'll have to say that again. I lost you on  
24 that.

25 Q. Okay. In your opinion, then, are the Oil

1 Conservation Division regulations --

2 A. These regulations here?

3 Q. Those regulations -- as they apply to annular  
4 seals to prevent artesian water from -- excuse me -- whatever  
5 is down there, from coming to the surface inadequate? .

6 A. They're just -- it's very general. It says what  
7 it needs to say to protect water, but it doesn't say how you do  
8 it.

9 Q. Okay. You just mentioned that when you're  
10 drilling into Mancos Shale that you have to use mud.

11 A. You may. I'm sure -- there's all types of fluids  
12 and additives that you can use to get by with. But one issue  
13 is the swelling of the shales and stuff when it comes in  
14 contact with water.

15 Q. Okay. Why don't you tell us a little bit about  
16 any risks you see associated with drilling muds?

17 MR. HALL: Mr. Examiner, I think I'm going to object.  
18 There's no evidence at all these wells are going to be drilled  
19 with mud.

20 MR. A. TRUJILLO: It could be. We might as well have  
21 Mr. Finch answer his question regarding drilling additives. I  
22 think that if these four applications have been granted -- if  
23 the six are granted, the County would at least request that  
24 there be some condition applied to these applications, some of  
25 which could be that certain additives not be used, maybe that

1 drilling mud not be used if there's a viable alternative. And  
2 I think that Mr. Finch is at least entitled to give his opinion  
3 as to what problems he could foresee in using drilling mud.

4 MR. HALL: I'll withdraw the objection.

5 MR. BROOKS: Okay. Go ahead and answer the question.

6 A. Okay. I'll just go right to one of these  
7 permits, Exhibit 2.

8 Q. (By Mr. A. Trujillo): Which one?

9 A. Under drilling methods. It says fresh water  
10 brine, diesel oil-based, gas air.

11 Q. Which box is checked?

12 A. Gas air.

13 Q. Okay.

14 A. And diesel oil-based, that's obviously not a good  
15 idea in a watershed such as this. Brine, for the same reason.  
16 And I don't think you can drill this with fresh water, because  
17 of the problems I mentioned before. So they have appropriately  
18 chosen gas air, but the problem with gas air is that you still  
19 have to sometimes add some kind of fluid to make it work -- or  
20 additive. And it doesn't specify what those additives may  
21 be --

22 Q. What additives?

23 A. -- on the permit, so I just don't know. There's  
24 a multitude of things that may be used.

25 Q. Give us an example.

1 A. Foaming agents could be used.

2 Q. Are those toxic?

3 A. Some can be. Some are approved. A water well  
4 driller in Ruidoso was shut down because he was using foaming  
5 agents that weren't approved by the AWWA and that stuff was  
6 getting into -- not a live water course, but just an arroyo.  
7 So there's a lot of things that even water well drillers are  
8 subject to. But you don't know until someone provides you with  
9 a plan of what's being used. And in our municipal well  
10 projects we require all drillers to provide us a list of all  
11 the materials and additives that will be used for their  
12 drilling.

13 Q. In water well drilling?

14 A. In water well drilling for public supply.

15 Q. Not for private use?

16 A. Domestic wells are different. Because, you know,  
17 we use -- they're -- I don't think the burden is put on the  
18 individual well owner.

19 Q. Mr. Hall questioned you on the drainage on the  
20 Sultemeier property.

21 A. Right.

22 Q. Do you recall that drainage that starts at the  
23 top of the mountain and comes down to the Sultemeier's  
24 property. How -- is there any way to tell how often that  
25 drainage would run?

1 A. The best bet would be to ask the Sultemeiers.

2 That's what I would do.

3 Q. Would it be seasonal?

4 A. Yeah. I'm sure it is seasonal, at the least.

5 Q. At the least?

6 A. Yeah. I mean, whatever -- there are certain  
7 conditions and things that you get, you know, ample snow pack,  
8 if -- what the monsoons bring you. There's all kinds of things  
9 that happen seasonally that create runoff.

10 Q. Okay. Mr. Hall questioned you regarding  
11 closed-loop systems and tried to imply that you -- if these --  
12 let me see. I need to be very careful in phrasing this  
13 question. Are these well sites as you know them, appropriate  
14 for oil drilling from a hydrological standpoint?

15 A. Well, the Woolley Family No. 1 is a place I  
16 wouldn't. If I was a consultant to the oil and gas drilling  
17 company, I would not recommend that as a place.

18 Q. Any others?

19 A. Well, I would point out the Sena No. 2 and the  
20 Sultemeier No. 1 are very obvious locations that are just right  
21 in the middle of areas subject to storm water and erosion or  
22 sheet flow or whatever. Too much hydrologic implications.

23 Q. Now, I'd like to talk about the hydrologic  
24 imbalance. Now, by virtue of placing a well pad at any of  
25 these locations, what is your professional opinion as it would

1     apply to the hydrological balance of this ecosystem?

2             A.   Well, it depends on the footprint and where it's  
3     placed.

4             Q.   Let's say for the sake of argument we can make an  
5     example from the Sultemeier Well No. 1.  From a hydrological  
6     standpoint, what is the --

7             A.   Well, erosion is obviously the issue.  It seems  
8     to be evident already.  And then I would see it as a problem in  
9     most of the areas up at the TA Creek Watershed.

10            Q.   And why is that?

11            A.   Because of the proximity to water.  You know,  
12     where they're located is in the bottoms of these drainages.  
13     And, you know, you just -- that's why I was recommending the  
14     site-specific study stuff to do a hydrologic analysis to  
15     determine if that's a good place for a pad or not and how it  
16     would affect the hydrologic cycle.

17            You know, one problem -- one thing that is spelled  
18     out in the regional water plan is to protect those watersheds  
19     to ensure long-term supply and quantity of water.  And it's so  
20     evident throughout that plan, and there's a good technical  
21     argument and basis in the plan.  I just touched on some of the  
22     highlights out of that thing, but the plan is a thick document.  
23     And their recommendations are to not have any development at  
24     all in those upper watersheds like TA Creek, including even new  
25     roads.

1           So I think a well pad would just add to that -- or  
2   you would include that in that same type of analysis. If they  
3   are saying no new roads to maintain and protect water, you  
4   know, that's a well pad site is the same thing as a new road,  
5   so it's -- you obviously have some kind of impact. That's what  
6   their analysis shows.

7           Q. Would a well pad placed on the Woolley property,  
8   as you know it, affect the hydrologic balance of that drainage?

9           A. Yeah. I mean, that's what we talked about. It's  
10  in a wetland, right? So that obviously will have some bearing  
11  on it. The big thing mentioned in that water plan, again -- I  
12  hate to harp on that or keep bringing it up -- but one of the  
13  problems with water supply in the area is the peak summer -- or  
14  the summer demands.

15           There's a good amount of water that comes out through  
16  the spring. We've seen that. And it's going everywhere, but  
17  it runs off fairly fast and then it starts to dry up through  
18  the summer and those acequias and the streams suffer. And  
19  there's a shortage in the supply during those months when they  
20  need it most.

21           And so that's one reason why they've come up with all  
22  these alternatives and recommendations to protect those  
23  watersheds. It's to try and maintain and even increase the  
24  yield so they can have the water available to promote  
25  irrigation and the things that are already established there.

1 Q. So would you recommend, then, a site-specific  
2 hydrological study on any present or future applications to  
3 drill oil wells in the Rio Chama Watershed.

4 A. Well, yeah, certainly.

5 Q. Now, was a hydrological study performed on any of  
6 those -- prior to filing of any of these applications by  
7 Approach Oil?

8 A. Nothing was presented to me. There's nothing  
9 mentioned on the permits that I'm aware of, of a particular  
10 study. There's no conditions of approval for a study. So I'm  
11 not aware of any study that related to these permits.

12 Q. Now, were you here for Ms. Sulzemeier's testimony  
13 this morning?

14 A. I was.

15 Q. Did you hear Ms. Sulzemeier testify that she was  
16 contacted by Approach two weeks ago to inform her that they  
17 were going to be taking a hydrologist onto her property?

18 A. I heard that.

19 Q. And if you turn to Exhibit No. 2, two weeks ago  
20 was when, the 20th of June? When -- when was two weeks ago,  
21 Mr. Finch?

22 A. June 7th.

23 Q. Now, what is the date of this application for  
24 Ms. Sulzemeier's property? Do you see it in the bottom  
25 right-hand corner right above the signature?

1 A. Oh, stamped in?

2 Q. Yes.

3 A. OCD's stamp is September 4, 2007.

4 Q. Does that lead you to believe that this  
5 application was filed before any hydrological study was  
6 conducted on the effects of placing an oil well in  
7 Ms. Sultemeier's box canyon?

8 A. Yeah, it does.

9 MR. A. TRUJILLO: No further questions.

10 MR. BROOKS: Normally, I do not allow redirect -- I  
11 mean recross, however, it seems to me there were a number of  
12 questions asked in redirect that were not covered in direct.  
13 Do you wish to do recross on those subjects that were not  
14 covered in direct, Mr. Hall?

15 MR. HALL: Very briefly.

16 MR. BROOKS: Okay. You may do so. Please limit it  
17 to subjects that were not covered on direct so a perpetual  
18 motion --

19 RE CROSS-EXAMINATION

20 BY MR. HALL:

21 Q. I do want to ask you about the hydrologic  
22 balance.

23 A. Okay.

24 Q. What does that mean?

25 A. Well, there's, you know -- a lot of these

1 measures and stuff that are required by the OCD or the  
2 Environment Department are related to protecting water quality,  
3 and the balance is more related to quantity.

4 Q. We've seen some of the exhibits, including some  
5 of your slides, are photographs of the fields that have been  
6 disked and plowed. Do those affect the hydrologic balance?

7 A. Well, yes. And they have the right to do so.  
8 The State Engineer allows that through a permitting process.

9 Q. It allows plowing and disking?

10 A. Apparently, agriculture and surface water rights  
11 the state gives -- has established a use of that.

12 Q. Okay. Well, here's what I'm getting at. Does  
13 plowing and disking result in any erosion that affects the  
14 hydrological balance?

15 A. From my familiarity with the practices of  
16 irrigators and farmers, the last thing you want is erosion  
17 because then you lose all your soil. You have nothing to grow  
18 on or with. So the first thing they're going to try to do is  
19 design their systems to prevent erosion.

20 Q. Okay. So the answer to my question is yes?

21 A. Is no. The answer, if you're -- they do not --  
22 their practices aren't to allow erosion, it's to prevent it.

23 Q. Does erosion occur from plowing and disking?

24 MR. A. TRUJILLO: I'm going to object as asked and  
25 answered.

1 MR. HALL: I don't think he's answered the question,  
2 Mr. Examiner.

3 MR. BROOKS: Okay. Overrule the objection. You may  
4 answer the question.

5 A. Okay. It will provide -- it could provide  
6 erosion locally within the field. But it all depends on how  
7 the farmer applies water to his field.

8 Q. (By Mr. Hall): Does sheet flow occur over plowed  
9 and disked fields in this area; do you know?

10 A. I'd have to go and look at it. I couldn't answer  
11 that question. My recollection of visiting irrigation areas in  
12 the Chama area are that a lot of them are bermed because of the  
13 acequias themselves. It provides a natural barrier to flow  
14 into the field.

15 Q. Okay. You've seen eroded plowed and disked  
16 fields in this state, have you not?

17 A. No. I have not seen -- up in either the Chimayo  
18 or Chama area erosion problems related to irrigation.

19 Q. How about from grazing?

20 A. Now, I have from grazing.

21 Q. Okay. Are you familiar with -- this is getting  
22 beyond your direct.

23 MR. HALL: I'm finished with the witness,  
24 Mr. Examiner.

25 MR. BROOKS: Okay. Very good. I have a couple of

1 questions to ask the witness and this won't count against  
2 anybody's time, and I will be very brief.

3 EXAMINATION

4 BY MR. BROOKS:

5 Q. If I read your conclusions, you have two specific  
6 recommendations: One is closed-loop systems and the other is  
7 the use of, you say, a better annular seal, correct?

8 A. Yes, sir.

9 MR. A. TRUJILLO: I'm going to object to the  
10 mischaracterization of Mr. Finch's testimony, Mr. Hearing  
11 Examiner. I believe that Mr. Finch just testified that one of  
12 his primary recommendations was site-specific hydrological  
13 studies prior to applications being filed.

14 MR. BROOKS: Well, perhaps Mr. Trujillo, that is a  
15 qualification of the question. The word I used, which was  
16 specific, I do recognize that that's one of the things that he  
17 has recommended, and I regard that as his general  
18 recommendation. So I'm looking to the specific  
19 recommendations, because what I'm looking to hear is supposing  
20 the Division were to grant -- were to determine that they  
21 should grant these applications with some conditions, what  
22 conditions can we put on them?

23 Q. (By Mr. Brooks): And the two things you  
24 mentioned here that are specific in nature would be closed-loop  
25 systems and a better annular seal. Now, closed-loop systems I

1 think we're going to hear some more testimony about from the  
2 defendant, so I won't go into that further at the moment.

3 Before I go into that, there's one other question of  
4 a general nature I have for you. You have not testified to  
5 anything about depth of groundwater that I've heard.

6 A. I did.

7 Q. Well, you testified that there was some very  
8 shallow groundwater.

9 A. Correct.

10 Q. What I'm concerned with here is not how deep the  
11 depth from the surface to the groundwater, but the depth to the  
12 bottom of the groundwater. You don't have any knowledge about  
13 that in this area?

14 A. Well, yeah. The table of wells that I had as one  
15 of my slides --

16 Q. Okay. Could you call my attention to that,  
17 please?

18 A. Okay.

19 Q. Is it the table on the bottom of Page 4?

20 A. Yes, sir.

21 Q. And I believe that table is not in your technical  
22 presentation, Exhibit 19; is that correct?

23 A. That is correct.

24 Q. Could you undertake to provide to Mr. Trujillo  
25 and have him provide to us for the record a larger copy of that

1 slide, because the small copy that was provided here is  
2 essentially illegible, and I don't think anybody will be able  
3 make anything out of it. Could you put that slide up on the  
4 screen, please?

5 A. Sure.

6 Q. Okay. I cannot read that on the screen. Okay,  
7 there I can sort of read it.

8 Okay. Tell us what that indicates about how deep  
9 groundwater goes in this area?

10 A. Okay. You can see that the depth of water in the  
11 shallow wells is shallow, and that's because a lot of those are  
12 in the alluvium. Then you go to very bottom and there are some  
13 deep wells, 1,000 feet and even 2600. And the depth of water  
14 there is on the order of 600-something feet.

15 And that's because in the Mancos Shale and some of  
16 the formation under it there are these sandstones that have  
17 their own -- essentially separate units that have their own  
18 pressure.

19 Q. And you're saying that there is fresh water below  
20 the Mancos?

21 A. In the Dakota, there is.

22 Q. Okay.

23 A. The Dakota sandstone -- and then the regional  
24 water plan lists several wells that produce from sandstones  
25 within the Mancos Shale.

1 Q. Now, what do you understand to be the objective  
2 formation for this well? You testified to it, but I have  
3 forgotten -- for these wells.

4 A. It's the Graneros Shale, I believe. It's a  
5 shale.

6 Q. Where is that located --

7 A. In the sequence of geology?

8 Q. In the sequence, yeah, as compared to the  
9 freshwater formations?

10 A. It's in the bottom section of the Mancos Shale  
11 and above -- directly above the Dakota sandstone.

12 Q. Now, do you -- have you correlated these areas?  
13 Do you have an opinion as to whether or not there would be  
14 fresh water in formations at or below the target formation in  
15 the area where these applications have been filed?

16 A. Yeah. I mean, this is evidence here that there  
17 should be fresh water all the way down to the Dakota sandstone.  
18 I mean, there may be pockets of water that are saline or what  
19 they're looking for. They could find some pocket of oil or gas  
20 or something, but -- in the fractured shale, but there is fresh  
21 water in the sandstones above and below the target formations  
22 listed on these permits.

23 Q. Okay. That's what I was trying to get to. And I  
24 do not know precisely where these locations are or where these  
25 water well locations are, but I suppose some correlation to

1     that can be worked out.  Although --

2                 MR. A. TRUJILLO:  Mr. Hearing Examiner, I would offer  
3     that Mr. Finch can testify right now where these locations are,  
4     just prior to --

5                 A.  It's in the townships surrounding the permitted  
6     area.  I apologize.  I didn't have a chance to make a map to  
7     show where these are.  If I had more time to prepare, I would  
8     have loved to have had a map with these wells on it.

9                 Q.  (By Mr. Brooks):  Okay.  Very good.  That's what  
10    I was inquiring about.

11                Now, let us talk a little bit about the annular seal  
12    that you were talking about.  First of all, your experience is  
13    in water well drilling, correct?

14                A.  Yes, sir.  I have very limited experience in oil  
15    and gas well drilling when I was apprentice geologist in the  
16    1980s.

17                Q.  Okay.  And there are a lot of people that have a  
18    lot of experience with oil well drilling and casing design and  
19    cementing design; is that correct?

20                A.  That's right.  It's a science all in itself.

21                Q.  It's a specialty?

22                A.  It really is.

23                Q.  Now, I gathered from what you said on redirect  
24    that your primary concern was -- and when you first went into  
25    it, I had a little trouble understanding conceptually why you

1 would need a larger -- why a larger annular space would result  
2 in a better seal. But if I understand it -- correct me if I'm  
3 wrong -- if I understand what you said, where your concern is  
4 that you will not get the cement to fill the annular space if  
5 it's too small. Is that what you're telling us?

6 A. Exactly right.

7 Q. Okay. Very good. I just wanted to understand  
8 that. I think that's all my questions.

9 MR. BROOKS: Does either side have followup based on  
10 my questions?

11 MR. HALL: I do not, Mr. Examiner.

12 MR. BROOKS: Very good. The witness may step down.

13 MR. T. TRUJILLO: The County calls Dr. Terrance  
14 Boyle.

15 MR. BROOKS: For informational purposes, according to  
16 my tabulation, the County has 1 hour, 53 minutes remaining.

17 MR. HALL: Mr. Examiner, I wonder if I can make a  
18 request of Mr. Trujillo to have his PowerPoint slide show  
19 available to us again on Monday?

20 MR. T. TRUJILLO: I may have not have -- I can have  
21 the PowerPoint presentation available, but I think may not have  
22 her available. I will not have her available.

23 MR. HALL: Could we have the disk?

24 MR. A. TRUJILLO: We can provide you with the disk.

25 MR. HALL: Great. Thanks.

1 MR. A. TRUJILLO: You're going to have to find your  
2 own operator.

3 MR. BROOKS: Well, I suspect we have some people  
4 upstairs that can assist us if necessary. I have no idea how  
5 to do these things, but there are some people in this agency  
6 who do.

7 MR. A. TRUJILLO: Dr. Boyle, let me know when you're  
8 ready.

9 What we could do, Mr. Hearing Examiner, if it pleases  
10 you, in the interest of saving some time, I would prefer to  
11 read a list of qualifications for Mr. Boyle and submit it to  
12 Mr. Hall for his approval or objection.

13 MR. BROOKS: That would be acceptable.

14 MR. A. TRUJILLO: Dr. Terrence Boyle received his PhD  
15 from the University of Arizona in 1979. He has more than 100  
16 scientific publications, including three books on various  
17 aspects of applied ecology, ecotoxicology, and environmental  
18 science. He was on faculty in fisheries and wildlife biology  
19 and the graduate degree program in ecology at Colorado State  
20 University where he taught the graduate level course,  
21 "Ecological Risk Assessment."

22 He was the editor of the international journal,  
23 Environmental Toxicology and Chemistry from 1997 to 2001, and  
24 one of the inaugural editors of the new journal, Integrated  
25 Environmental Assessment and Management. He has had research

1 projects in Latin America, the Philippines, and Russia,  
2 including three Fulbright Fellowships.

3 He has served on international boards for a number of  
4 international societies, a member of the US Man and the  
5 Biosphere Temperate Ecosystem Directorate and on the World  
6 Commission on Protected Areas and the IUCN.

7 Now, Dr. Boyle, is there anything that you care to  
8 add to this list of qualifications?

9 THE WITNESS: It would get kind of laborious, but  
10 basically my relevant qualifications for testifying here is I  
11 am an ecotoxicologist. I've dealt with environmental  
12 toxicology at the laboratory level, field assessment, and  
13 integrations of a number of assessments of impacts in the  
14 environment ranging from mining to land use.

15 MR. A. TRUJILLO: Now, the County would offer  
16 Dr. Boyle as an expert witness in the fields ecotoxicology and  
17 in ecological risk assessment.

18 MR. BROOKS: Any objection, Mr. Hall?

19 MR. HALL: Well, Mr. Examiner, I'd appreciate a  
20 little bit more foundation with respect to relevance to the  
21 applications here. I'm not sure why he's being tendered.

22 MR. BROOKS: I'm sorry. I think that the issue here  
23 is the witness' qualifications, so I will overrule the  
24 objection. The witness is qualified as requested and relevance  
25 to his testimony may be subject to objection at the time he

1 testifies.

2 You may proceed.

3 TERRENCE P. BOYLE, Ph.D.

4 after having been first duly sworn under oath,

5 was questioned and testified as follows:

6 DIRECT EXAMINATION

7 BY MR. A. TRUJILLO:

8 Q. Dr. Boyle, have you prepared -- have you had a  
9 chance to review any of the information associated with the  
10 applications in this matter?

11 A. I haven't reviewed the applications per se, but I  
12 did make site visits to the Rio de Tierra Amarilla, which is  
13 the proper name for this creek, on June 11th and June 13th, and  
14 I've looked up a number of documents relating to oil  
15 contamination and risk in the environment, and I've prepared  
16 this particular presentation on the basis of those.

17 Q. Why don't you take us, then, through your  
18 presentation?

19 A. Okay. Let's see here if I remember how to do  
20 this.

21 Okay. Just to sort of review what we're talking  
22 about, the El Rito de Tierra Amarilla is the official  
23 designated name of the water body that we're talking about.  
24 That's how it appears on USGS maps, on EPA maps and whatnot.  
25 The size of the watershed is approximately 61.3 square miles.

1 Land use/cover is 70 percent forest, 25 percent in rangeland, 5  
2 percent in agriculture, and urban water surface areas, about  
3 less than 1 percent.

4 It's kind of unique in at least New Mexico in terms  
5 of high watersheds in that the land is completely privately  
6 owned. There's no Forest Service or BLM land in this thing.  
7 And the present status of El Rito de Tierra Amarilla, this map  
8 I've taken from the US EPA documents on the water quality. I  
9 want to summarize, if I can, several aspects of this.

10 This is Tierra Amarilla. This is El Rito de Tierra  
11 Amarilla. The line right here is Highway US 64 which crosses  
12 the river here, switch-backs up here and then finally gets back  
13 onto Forest Service land up here. The site set we looked at  
14 were the Woolley site, which is approximately right here -- and  
15 I'll talk about these in more detail -- the two Sena sites,  
16 which are approximately in here, and the one Trujillo site.  
17 Several things --

18 Q. Which was where? In the same area?

19 A. Yeah. Let's see if I can get this thing to --  
20 the two Sena sites I believe are in here. And the Trujillo  
21 site was immediately upstream from John Sena's house, the ones  
22 he showed. Again, I'll show these in more detail and  
23 photographs as we come along.

24 But what's interesting about this particular map:  
25 Two things, one it shows the river headwaters up here. They

1 actually -- there's a diverse set of tributaries in this region  
2 right in here that go all along here and they all arise from  
3 small lakes and wetlands.

4 The second thing is in the upper sites there's very,  
5 very high snowfall. When I went up there prior to these two  
6 June trips -- I think it was in April -- looking for some  
7 places to ski, the road was blocked. And at the road block,  
8 the snow behind it is five to seven feet deep on US 64.

9 Q. What month was that?

10 A. That was about April, sometime in April. So the  
11 area, the upper area, is inaccessible except probably by  
12 snowmobile in the winter. And, again, you know, winters vary,  
13 so this last one was pretty high in snow. We may get a dry  
14 winter and whatnot. But they do usually block that road during  
15 the wintertime up there.

16 The second thing there is -- this is from a US EPA  
17 water document on the water quality uses of this stream, and  
18 I'll speak more of this as we go along. But basically, from  
19 this point on down as designated by that orange highlight,  
20 Tierra -- El Rito de Tierra Amarilla is impaired as a cold  
21 water fishery on the basis of several factors, which I'll go  
22 into. The upper area is now not impaired.

23 Q. Who makes the determination?

24 A. The US EPA makes that determination in this case  
25 and it's under the TMDL Program, which is Total Maximum Daily

1 Load. Basically there are two ways of looking at insults to or  
2 impacts to streams. One is permitted, and these are usually  
3 point sources that in this state the EPA permits based on what  
4 the toxicity of the release is, and what the water flow is. It  
5 would be like an outfall from a sewage plant or an industrial  
6 plant.

7 The rest of these impacts on stream ecosystems fall  
8 under the non point source designation. And these are legal  
9 terms, point source and non point source. And to address  
10 those, the EPA has come up with up this Total Maximum Daily  
11 Load where it looks at the number of insults within the  
12 watersheds of these streams, what produces them, and how to go  
13 about collecting that so they can bring the use back up into  
14 compliance. And I'll have more on this also.

15 But this is a very good slide here in that it  
16 shows -- you've see this before -- but basically this ribbon  
17 here is US 64. John Sena's land is approximately in this  
18 region. This is where the bridge crosses. And you can kind of  
19 see Tierra Amarilla Creek taking off here. And from here on  
20 down, again, the EPA has determined that this creek is not --  
21 is impaired -- is not in compliance for the parameters that  
22 would support a warm water fishery.

23 MR. BROOKS: I thought you said cold water fishery.

24 THE WITNESS: Cold water. I'm sorry. Thank you.

25 A. And cold water fishery designation usually means

1 there's trout in there and trout are an extremely sensitive  
2 fish to a number of different contaminants; much more sensitive  
3 than most other groups of fish.

4 Again, you can see in the background here the divide,  
5 and this is the region of really, really high snowfall up here.  
6 And, according to John, there's very, very high snowfall all  
7 over here. But the road is usually blocked approximately in  
8 this region right here almost every winter.

9 Okay. This is the upper part of the US 64 where it  
10 gets about 9,000 to 10,000 feet. And it is in this region that  
11 the Woolley site is and that is right in here. And you've  
12 already seen this. And what you're seeing here, also, that the  
13 previous speaker brought out is there's a system of wetlands up  
14 here that actually provide the actual head of the watershed  
15 feeding the El Rito de Teirra Amarilla.

16 Q. (By Mr. A. Trujillo): Now, Dr. Boyle, this is a  
17 previously unseen photograph, but it is marked as County  
18 Exhibit No. 36.

19 Now for proper indication of this photograph, so that  
20 it may be moved and admitted into evidence -- actually, excuse  
21 me. I'm sorry. I apologize. This has already been admitted.

22 A. Okay. All right. The Woolley site is exactly  
23 right here. And this and in the surrounding area you can see  
24 open water and it is a complex wetland. And it's defined as a  
25 wetland because it's standing open water at least the times of

1 year that we were up here.

2 And the next four slides are going to define that as  
3 a wetland. Okay, I'm going to have a photograph of the actual  
4 stake with the Woolley on it. You're not going to be able to  
5 read the Woolley, but this is where they --

6 Q. And Dr. Boyle, is this -- this is a series of  
7 pictures that we to authenticate. Dr. Boyle, did you take this  
8 photograph?

9 A. This one?

10 Q. Were you present -- no. The next photograph.

11 A. Yeah. Well, let me just go on there because  
12 there's four slides I want to summarize here. There's -- I  
13 think I'm going to abandon that.

14 There's four slides here. One is where the actual  
15 stake is, the survey stake. And then immediately in this  
16 vicinity, you'll see some springs that are upwelling from that  
17 wetland. And then there's two reaches of the stream  
18 approximately here and here. Now, that's the stake in the  
19 middle of the wetland that they put that has Woolley Site  
20 written on it. I assume it's in the center, but I don't know.  
21 There's several other survey markers surrounding it.

22 And this is wet land, okay? And it has wetland  
23 vegetation types on it. This is maybe 30, 40 feet from it.  
24 There's typical wetland sedges and these are skunk cabbage,  
25 which is very, very typical of wetland type of vegetation. And

1 you can see one of the many springs popping out right there.

2 And there in the back is the survey marker.

3 This is just on the other side maybe 30 or 40 feet  
4 from it also, still within that wetland. Again, typical  
5 wetland vegetation and open water where the springs are coming  
6 up.

7 This is a short distance, maybe 50, 60, down from  
8 that last slide, and this looks like to me a typical trout  
9 stream. For reference in size, this is a quarter we put in the  
10 bottom of the stream. So you can see what the relative size  
11 and volume of water. This is very, very good trout habitat.  
12 You can see the gravel and stones on the bottom. And probably  
13 another 100, 150 feet past that -- again, a very, very typical  
14 type of stream. This again is one of the headwaters in a  
15 complex of tributaries that go in and form El Rito de Tierra  
16 Amarilla. And this is in the vicinity very close to the  
17 Woolley Site.

18 Now, this is John Sena's land and John Sena's house.  
19 And I want to point out a couple of things here. One is that  
20 site that he mentioned -- and this is a repeat of that slide  
21 and it's approximately right here -- and right here you can see  
22 the contours and the striations, is one of the sites that  
23 the -- it's the old Soil Conservation Service and I keep  
24 mispronouncing the name, but I think it's National Resource  
25 Conservation Service -- what they are doing is trying to

1   reclaim the watershed in the light of that impairment  
2   designation by the US EPA. And there are a number of sites  
3   like this within that area. The actual well is going to be  
4   right upstream from that.

5           And this again, is a similar site. But what I want  
6   to point here, the Trujillo site is just maybe a quarter of a  
7   mile from this right here. And I don't have an aerial  
8   photograph of it. But it is of similar dimensions to this site  
9   right here where you have El Rito de Tierra Amarilla on one  
10   side and on the other side in approximately the same  
11   dimensions, you have an acequia. And right in the middle of  
12   that site is the survey marker for the Trujillo site. But  
13   again, that occurs off the photograph up here. But it has  
14   similar dimensions. To repeat myself, it's in the middle of  
15   the zone that's irrigated with the acequia on one side and El  
16   Rita de Teirra Amarilla on the other side.

17           Now, this is the upper Sena site, No. 2. As John  
18   mentioned, there are several of these reclamation efforts  
19   within these meadows up here. And again, this is by the  
20   National Resources Conservation Service. And what they've done  
21   here is fence the headwaters, the wet areas to prevent erosion  
22   and to establish a seed bank for recovery of these areas. And  
23   again, this is a response to that bad TMDL designation by the  
24   EPA. And the problem is, is that they are putting the well  
25   right above those reclamation sites. So while we are trying to

1     reclaim it, they're going to put an exploratory well in there.

2             I don't have to repeat too much of his testimony, but  
3     there's a creek, a running creek draining right here with water  
4     in it. And the access to this area would require a  
5     considerable amount of road building because of the  
6     precipitousness of the existing well. It's called Ball Breaker  
7     Hill. When we went in there, we had to use low range 4-wheel  
8     drive to get up this thing to this area. So you're not going  
9     to drag a huge piece of machinery up there without a  
10    considerable amount of road preparation and subsequent erosion.

11            Let me go back here, because I think this thing  
12    skipped over one of the things I want to talk about. Okay. In  
13    order to regulate streams in terms of water quality, there's  
14    designated uses on those. And there's a number of uses that  
15    are designated for El Rito de Teirra Amarilla. There's  
16    domestic water supply, fish culture, high quality cold water  
17    fishery, which has that impairment where I showed that on the  
18    lower portion, irrigation, livestock watering, wildlife  
19    habitat, and secondary contact.

20            Now, each one of those uses has a body of scientific  
21    data around it with generally-not-to-exceed parameters in it.  
22    In other words, the domestic water supply has a number of  
23    parameters of when you cannot drink it or it's going to be  
24    toxic to you. Fish culture the same.

25            High quality cold water fishery has not only chemical

1 parameters around it to protect it, but also physical  
2 parameters around it. Again, irrigation has certain parameters  
3 that will protect the crops, livestock watering. It's probably  
4 pretty similar to the domestic water supply because cattle are  
5 pretty similar to us in terms of what they can tolerate.

6 Wildlife habitat is a physical and then secondary  
7 contact is swimming. In other words, this water should have  
8 not have any chemicals in it that you would pick up through  
9 your skin that would get a toxic response. So these are legal  
10 terms, okay? These are state current uses of El Rito de Tierra  
11 Amarilla up there. And one of them is violated for a  
12 substantial reach already. And the parameters of concern  
13 within that reach -- and again, I'll show this map again, but  
14 this is the one that was highlighted in yellow/orange, the  
15 parameters of concern are turbidity, stream bottom deposits --  
16 in other words, the physical condition of the bottom.

17 Do you remember I showed you the high quality stream  
18 in the upper thing that had a lot of gravel? Well, this in the  
19 bottom has a lot of sediment in it which affects the macro  
20 invertebrate community which fish depend upon for eating and  
21 also for habitat for spawning.

22 Okay. Now, also temperature. The temperature is too  
23 high in the stream really to support an adequate high quality  
24 cold water trout fishery. Okay. And in this EPA report, the  
25 uses that affected the high quality cold water fishery were

1 identified as: Range grazing and riparian wetland contributing  
2 to the erosion; removal of riparian vegetation, probably due to  
3 grazing, but some road building; road maintenance and runoff;  
4 flow regulation and modification probably due to some dams  
5 and/or acequias and agriculture.

6 So those are the things that the EPA has identified  
7 within this stream as contributing to the impairment status of  
8 the El Rito. Now, what we kind of are addressing here are  
9 three wells, one permitted, one proposed -- and these are the  
10 four that I visited on June 11th and June 13th. And there's an  
11 additional, I believe, six proposed. After listening to this  
12 testimony, I know there's a total of 10, but I'm not sure of  
13 what the actual proposed statuses are, and I'm sure I can be  
14 corrected by both of the counselors here.

15 These well sites that I visited have a high potential  
16 for impact on surface and groundwater, and in addition,  
17 potential runoff for sedimentation from the El Rito de Teirra  
18 Amarilla -- in the Tierra. This additional runoff would be  
19 cumulative to what is already being added by those parameters  
20 that I listed before. You know, the agriculture, road  
21 building, grazing, removal of riparian vegetation. So anything  
22 else is going to be cumulative on top of that. It's not going  
23 to be separate from it.

24 And again, just to show you where that is, this is  
25 the impaired section running from about where the highway

1 bridge crosses -- 64 crosses the El Rito de Tierra Amarilla  
2 down to Tierra Amarilla itself. And again, this map is taken  
3 from the EPA report.

4 Okay. Now, to kind of organize the existing data in  
5 my observations, I want to introduce the risk analysis  
6 paradigm. I'm not cooking this up. It has a definite long  
7 pedigree. Risk analysis was first adapted by the National  
8 Institute of Health to assess the effects of environmental  
9 stress on human health. And then by the EPA in 1992, the  
10 paradigm was used to assess the effects of environmental stress  
11 on the ecology and natural resources.

12 There are societies of risk analysis. One society  
13 that I belong to, Environmental Toxicology and Chemistry, has a  
14 number of publications and books on it. There are a number of  
15 books just addressing human health risk assessment and  
16 ecological risk assessment. So this is a well-established  
17 paradigm. And basically, to define it, it is a process of  
18 defining and determining the probability of the type and  
19 magnitude of threats and the impact that these threats can  
20 cause.

21 Now, the simple guts of risk assessment are very,  
22 very simple -- and they have to be. Underlying this is a  
23 complexity of technical data that needs to be put in here, but  
24 the simple thing is there. The beauty of it is it integrates  
25 the science very well. In fact, you may have up there on any

1 kind of evaluation, toxicologist, environmental chemist,  
2 physicist, hydrologist -- and if they don't have something  
3 integrating them like this, you're going to get an absolute  
4 scientific cacophony.

5           It's also simple enough that lay people can realize  
6 what's going on and ask common sense questions. And basically  
7 there's three components to this: Before you have a risk you  
8 have a threat or a hazard that you can identify. This is  
9 separate of anything. Is this chemical toxic? Does it have a  
10 high distribution potential within the environment? That is  
11 the type of things you would ask. And you can ask questions of  
12 physical variables also.

13           The second thing that you really need to consider and  
14 that is out here, and that is what is the receptor of this  
15 threat or hazard? And receptors are usually in terms of -- not  
16 always -- but usually in terms of human health or parameters of  
17 human health or some kind of ecological receptor -- fish,  
18 invertebrates, birds, elk, whatever. So those are the  
19 receptors. And in order to establish ecological risk or risk  
20 in the environment, you need to connect those two things with  
21 what is the exposure to the receptor of the threat or hazard.  
22 Anytime if you don't have one of those three there, you don't  
23 have a risk.

24           And that is as simple as it gets. However, when you  
25 start doing real risk analysis, there's a complexity of

1 technical data that you need to establish what the toxicity is,  
2 what are the chemical and physical standards for various  
3 chemicals that would predict how they behave in the  
4 environment. What is the exposure in terms of magnitude. Is  
5 it going into the air? Is it going into the water? Is it  
6 going into the groundwater? And then, is that becoming exposed  
7 to a receptor?

8 So that's pretty simple to me and I think it's pretty  
9 simple to people that are on various boards and whatnot. So  
10 we're really addressing -- and again, we're still on the threat  
11 or hazard portion here -- is land use disturbance in terms of  
12 road building and developments at well sites.

13 And the question is: Will this add sediment to the  
14 stream involved and within the already impaired section of El  
15 Rito de Tierra Amarilla. And then to look at the --

16 Q. Dr. Boyle: Will it?

17 A. I don't know. We've used several methods to kind  
18 of estimate this. I worked in a park in northern Michigan, a  
19 national park called the Pictured Rocks National Lake Shore.  
20 It was about 170,000 acres. Half of this park was in a reserve  
21 which some exploitation was allowed in terms of forestry and  
22 development. Any activity that took place in there could not  
23 affect the streams downstream that were in the fee part of the  
24 park, the owned part of the national park.

25 And what we did is used the universal soil loss

1 equation, which in a geographical information system  
2 environment, looking at layers of vegetative cover that would  
3 lead to forestry practices, soil and its erodibility -- you can  
4 classify soils and their erodibility -- slope and slope length,  
5 and then a component of rainfall. And that equation will give  
6 you -- you do all the algebra -- it will give you loss per acre  
7 of soil in terms of the mass, total loss. So you can estimate  
8 those types of things using existing data.

9           And I don't want to say what's going to happen up  
10 there, because there's no data. You have a wetland. You have  
11 high slopes, certainly. You have places of input from road  
12 building, from pad development. But something like that would  
13 have to be analyzed and come up with a quantitative risk  
14 analysis before you can saying that. Certainly the potential  
15 is there from the road building and the sites that we've  
16 already seen. And then where they're going to put the sites  
17 that we already designated. So that's a potential.

18           And again, I'm not here doing a specific risk  
19 analysis. I'm pointing out the components that need to be  
20 there. Because to do a specific risk analysis like the  
21 previous speaker said, you really need some pretty good  
22 site-specific environmental data to get an idea of what might  
23 be happening.

24           But in terms of the threat -- and again, this is the  
25 first box on that risk analysis -- in terms of historical

1 things for the oil industry, I looked up some stuff on the web.  
2 And again, the Colorado record -- not for New Mexico, but one  
3 state north -- between 2002 and 2006 there were nearly 1,000  
4 spills of oil and gas chemicals and waste. And these include  
5 crude, condensate, produced water, other products, diesel  
6 fluid, glycol, amine, lubricating oil, hydraulic fractionating  
7 fluids, drilling muds and other chemicals. 60 percent of these  
8 spills involved produced water. 34 percent involved crude oil  
9 or condensate.

10 MR. BROOKS: This was in what geographical area?

11 THE WITNESS: This was the state of Colorado.

12 MR. BROOKS: Okay. Go ahead.

13 A. The source of this is -- again, the oil and gas  
14 accountability project.

15 Okay. To establish these chemicals, at least some of  
16 them or many of them have some kind of toxic response, there's  
17 another database I found. There's 172 chemicals used in oil  
18 and natural gas development and delivery in New Mexico. Now,  
19 this is exclusive of the Colorado stuff. So we're kind of  
20 overlapping here.

21 I'm not saying that all these chemicals were involved  
22 in the Colorado things, but they are involved in the New Mexico  
23 activities. And there's a number of -- 117 of these chemicals  
24 have skin and sensory organ toxicants. 115 respiratory  
25 toxicants. Do you want me to read this whole list, or is this

1 good enough?

2 MR. BROOKS: Well, if we could avoid reading it that  
3 would preferable because of the time.

4 A. Well, the point is, there's a huge number, 117  
5 out of 172 that have demonstrable toxicity to them, okay? And  
6 they are in various categories. And I'll give you five seconds  
7 just to kind of eyeball that thing because I don't think I want  
8 to read it all. Is that sufficient?

9 MR. BROOKS: That's sufficient.

10 A. Okay. This slide establishes that there are  
11 toxic chemicals used and a number of them in the oil and  
12 natural gas industry in New Mexico.

13 Another one I found was spills of pit chemicals in  
14 New Mexico. Between the mid-'80s and 2003, the New Mexico  
15 Environmental Bureau -- I think it's now called the Environment  
16 Department -- recorded 7,000 cases of pits causing soil and  
17 water contamination. And this Division here released data in  
18 2005 that shows that close to 400 incidents of groundwater  
19 contamination have been documented from oil and gas pits.

20 We're talking about contamination and a large number  
21 of it. So this is just defining the potential in that first  
22 box, "hazard." So this is a definite chemical hazard from use  
23 of oil chemicals within New Mexico and within the oil industry.  
24 And this is from the six wells. Three were in northwest and  
25 three were in southeast New Mexico. And this is just -- it's a

1 similar type of classification that's used by CERCLA and I'll  
2 have to read that. These are agencies compiling toxic lists.  
3 Comprehensive Environmental Response Compensation and Liability  
4 Act is CERCLA. And then Emergency Planning and Community Right  
5 to Know Act is EPCRA.

6 So this is the federal government compiling these  
7 data. These are not -- they are good data. And basically,  
8 what's showing is the number of chemicals on the list and then  
9 toxic chemicals on the list that are over state limits. And  
10 again, if we're going back to this thing, what we've  
11 established here is number one, that there are definite threats  
12 in terms of both sedimentation and toxic chemicals. And to  
13 some degree we have established that there is exposure. These  
14 things are fugitives from pits. They are fugitives in terms of  
15 the spill in the environment.

16 Okay. And then just a summary of how some of the  
17 exposures can enter the environment from drilling, hydraulic  
18 fractioning, waste pits, spills, of course, and releases into  
19 the air. Many of these chemicals that are used in oil  
20 processing have a great deal of volatility. They are toxic and  
21 they evaporate. You can get an exposure that way.

22 Now, the receptors portion of this thing -- of the  
23 risk analysis paradigm -- is very easy to come by because we  
24 already have it built in in terms of the water quality criteria  
25 for El Rito de Tierra Amarilla. We've already done this.

1 There is domestic water supplies, fish culture, high quality  
2 cold water fishery, irrigation, livestock watering, habitat,  
3 wildlife habitat and secondary contact.

4 The receptors are humans, hatchery fish, trout,  
5 crops, cattle and horses or livestock, riparian wildlife that  
6 live in the streams or live along the streams, and any little  
7 kid that goes swimming in the Tierra Amarilla. So what we have  
8 made here is a summary that there is a potential of threats  
9 becoming risks. And again, let me underline the potential  
10 here. I'm not doing an official full-blown risk assessment of  
11 anything at this point. This is a potential for risk  
12 becoming -- threats becoming risk due to release into the  
13 environment of a suite of chemicals used in oil exploration and  
14 extraction processes that have known toxicity, and secondly,  
15 the introduction of sediment into El Rito de Tierra Amarilla  
16 from land use disturbance due to drilling pad and associate  
17 road construction.

18 And that's about all I can really say at this point.  
19 But, you know, it's powerful in terms of what we have seen, in  
20 terms of the well siting in that area and what the potential  
21 for contamination is, and some preliminary recommendations.  
22 But because I've been on this for about oh, a week and a half  
23 or so and I'm familiar with risk analysis -- but a formal risk  
24 analysis should be performed considering the individual  
25 threats. And by individual threats, I mean identification of

1 those chemicals that are used in this drilling and all those  
2 activities, drilling, pits, extraction processes or whatnot,  
3 individual threats from sediment release. And again, you could  
4 do something like the strategy we used at the Picture Rock  
5 National Lake Shore with the universal soil loss equation, the  
6 potential for transport within the environment. This is the  
7 exposure terms.

8 In other words, it's not enough just to say these  
9 chemicals are toxic. Well, we all use toxic chemicals. This  
10 room probably has a number of them. But are we exposed to  
11 those things directly? Then estimations of the toxicity to  
12 representative organisms, both fish, invertebrates and whoever  
13 else is identified as a receptor, found within the various use  
14 designations of Tierra Amarilla. This includes estimations of  
15 the amount of sediment due to runoff into the waterway.

16 So let me echo what my predecessor said. There  
17 should be some methodical way of developing siting criteria for  
18 what these wells are going to be in terms of reducing the risk  
19 to the environment. And there should be some official risk  
20 analysis done before they are permitted and allowed to drill  
21 there.

22 And that's the end of my presentation.

23 MR. A. TRUJILLO: I pass the witness.

24 MR. BROOKS: Okay. I believe that you were in the  
25 process of offering some exhibits when your witness kind of

1 interrupted you, Mr. Trujillo.

2 MR. A. TRUJILLO: Mr. Hearing Examiner --

3 MR. BROOKS: There are some exhibits that have not  
4 been offered into evidence that you want to offer?

5 MR. A. TRUJILLO: If Dr. Boyle would like to offer  
6 his PowerPoint presentation into evidence, then I think that  
7 would accomplish that.

8 THE WITNESS: Yeah. You can have it. It's on this  
9 computer and you take it off of here.

10 MR. BROOKS: Okay. Well, but --

11 MR. A. TRUJILLO: The same time it would take --

12 Q. (By Mr. A. Trujillo): Dr. Boyle, were you  
13 present when these photos were taken that you introduced in  
14 your PowerPoint presentation?

15 A. For the Woolley Site, yes. I was not in the  
16 plane when they were taking the others.

17 Q. Are they an accurate representation of what you  
18 saw that day?

19 A. Yes.

20 MR. A. TRUJILLO: I offer them as evidence.

21 MR. BROOKS: Okay. Well, they're not marked as  
22 exhibits submitted.

23 MR. A. TRUJILLO: They are Exhibit 45, Exhibit 46,  
24 Exhibit 47, Exhibit 48, and Exhibit 49, and Exhibit 50.

25 MR. BROOKS: Any objection, Mr. Hall?

1 MR. HALL: No objection. Is it possible for us to  
2 get copies of the PowerPoint slides, hard copies?

3 THE WITNESS: Yeah. You can take them off here. I'm  
4 just going to leave my presentation on this computer. So --

5 MR. HALL: Okay.

6 MR. BROOKS: Could we have a hard copy available for  
7 us by Monday where we can get it marked and admitted into  
8 evidence, if it is deemed to be admissible?

9 MR. T. TRUJILLO: Absolutely.

10 MR. BROOKS: Okay. Very good. With that, then,  
11 we'll let Mr. Hall proceed to cross-examination.

12 CROSS-EXAMINATION

13 BY MR. HALL:

14 Q. Dr. Boyle, you referred at one point to the EPA  
15 report. Can you identify that for us?

16 A. It's a 2004 -- I don't have the citation in front  
17 of me -- but it's 2004 TMDL report for New Mexico, which I  
18 think includes -- well, I know it includes -- I think it's for  
19 New Mexico, and I know it includes Tierra Amarilla Creek. It  
20 includes another stream where they have it listed as fully  
21 compliant or impaired sections.

22 Q. Do you know where we can find it?

23 A. It's on the web. If you'd like, I can look it up  
24 and I'll be here on Monday and I'll be happy to give you a  
25 citation.

1 Q. Can you go back to your slide that showed your  
2 list of parameters resulting in the impairment of the lower  
3 creek?

4 A. Yeah.

5 Q. Go back to your first slide.

6 A. First one?

7 Q. Your map, yes, if you would.

8 A. Okay.

9 Q. Are those symbols for mine locations?

10 A. Yeah, they are. And again, I lifted this out of  
11 the website that had the report on it just simply to show -- I  
12 don't have an adequate map and I've not seen one that  
13 encompasses the whole Tierra Amarilla -- El Rito de Tierra  
14 Amarilla -- nor its section to the road. So I'm just using  
15 that as an illustration. But it is from that thing and they  
16 put -- it's the same geological that my previous speaker showed  
17 you. And those are -- I don't know if they are defunct. One  
18 of them, I think, is defunct because it's on John Sena's land  
19 and I believe it might be that one.

20 In other words, there's a coal mine there that hasn't  
21 been used for a number of years. And the other two, three,  
22 four, I don't -- they're not visible from the road, and I don't  
23 know what they are.

24 Q. Was the coal mine visible on Sena's land when  
25 you visited his land?

1           A. No. He pointed to where it was. It didn't look  
2 like -- there was no discharge coming from it or identifiable.

3           Q. All right. If I understand, you visited three of  
4 the sites; is that correct?

5           A. No. I visited four. I visited the Woolley Site  
6 and both John Sena's sites and then the Trujillo site was just  
7 upstream from John's land on the Trujillo property. That's the  
8 one where the sites had been placed between the acequia and El  
9 Rito de Tierra Amarilla.

10          Q. Okay.

11          A. Okay. Do you want to go back to this?

12          Q. Let's go to your parameter slide.

13          A. Okay. The parameters of concern -- and why EPA  
14 listed that stream as impaired were turbidity, which again, the  
15 previous speaker covered. Turbidity is a measure of optical  
16 quality of the stream. There's a lot of suspended -- the more  
17 suspended material there is in the streams, the sediment or  
18 whatnot, the higher the turbidity. And they have limits that  
19 you're not to exceed.

20                 Stream bottom deposits, they do an actual physical  
21 survey of the stream looking at what the composition in terms  
22 of particle size. And the particle sizes range from silt to  
23 sand to gravel to cobble. And I think there's more than that.  
24 They divided it up finer. And if they don't find a certain  
25 component within the stream bottom in a high quality cold water

1 fishery, then they consider it impaired.

2 I don't know if you remember that one slide I showed  
3 right down from the Woolley Site where there was a lot of  
4 gravel in there, that is a very, very good site. A bad site  
5 would look like there was a lot of mud and sediment in it. But  
6 this can be quantitatively determined. And the temperature is  
7 just temperature.

8 Q. All right.

9 A. And the temperature, again, all of these things  
10 are on repeated dates, so they have a table in this report  
11 exceed the criteria for high quality cold water fishery.

12 Q. Let me see if I can ask a question here. The  
13 focus of this slide, then, is sediment runoff from erosion?

14 A. The existing sediment runoff from erosion and the  
15 impairment of water quality, the habitat quality for lower  
16 portion of El Rito de Tierra Amarilla.

17 Q. And you've inventoried -- identified sources. Is  
18 this a complete list of identified sources?

19 A. Yeah, this is a complete list.

20 Q. For all of these contributing sources, are you  
21 able to allocate on a percentage basis to each --

22 A. No. I can't, no.

23 Q. Has that been done?

24 A. I don't think it has. I think what they  
25 identified is what was going on in the watershed and just

1 listed those sources as sources of sedimentation, which they  
2 are. I don't think anybody has done a budget for those. And,  
3 in fact, it would be -- unless they did something like that  
4 universal soil loss equation which is pretty intensive.

5 You could more or less get a skilled practitioner  
6 like somebody from the National Resources Conservation Service  
7 to go out there and say, "Oh, look. We have headwater erosion  
8 in some of the areas. Let's start addressing those problems."

9 That's the level of effort that this thing done was  
10 done with.

11 Q. Are you telling me it's not quantifiable or it  
12 has not been quantified?

13 A. I don't -- it is quantifiable. It has not been  
14 quantified.

15 Q. Okay. What do your instincts tell you is the  
16 greatest contributor?

17 A. Pardon?

18 Q. What do your instincts tell you is the greatest  
19 contributor?

20 A. I don't know. I just can't estimate. Every one  
21 of those, depending on the intensity of them, again -- if you  
22 look at the universal soil loss equation, it kind of leads you  
23 to start analyzing things. Now, what is the cover in terms of  
24 vegetation of these areas? Okay. What is the slope and the  
25 slope length? Are there differences in the runoff coefficient

1 from the various types of soils that are in this region? And  
2 then are there difference in the rainfall patterns of this  
3 region?

4 And you have all of those things there. So just  
5 having those four things in my head, I can't -- and I'm not  
6 going to risk doing it without having some more information.

7 Q. I understand. Tell me if I asked this before:  
8 This is not a exclusive list, is it?

9 A. It was an exclusive list in that document. Now,  
10 if there's forest fires going on, okay, that would add to that.  
11 I'm trying to think if there is anything else that I would know  
12 of that was going on in that watershed, and there's really not.  
13 But forest fires, certainly, would add to that list.

14 Q. Well, for instance, we don't see the mine sites  
15 you've identified as contributing, do we?

16 A. They didn't either. And I assume that they may  
17 not be contributors. I think those are small mine sites. The  
18 one that John pointed to was essentially invisible in the  
19 trees.

20 Q. Okay. In the course of your investigation here,  
21 did you determine that there were a number of oil and gas wells  
22 in the area that you visited?

23 A. No. I don't think there's any oil and gas wells  
24 in this are.

25 Q. Did you look?

1           A. Well, you know, we looked around. I don't know  
2 of any permitted gas or oil wells within the El Rito de Tierra  
3 Amarilla watershed.

4           Q. What databases did you survey to make that  
5 determination?

6           A. Well, if the data is not there, then it's --

7           Q. So you didn't search?

8           A. Well, it would have popped up in the search that  
9 I did, certainly.

10          Q. That's not my question. What did you search?

11          A. Well, I looked at oil and gas, Tierra Amarilla,  
12 El Rito de Tierra Amarilla, and none of those were listed in  
13 there, so --

14          Q. Did you not look in the Oil Conservation  
15 Division's database?

16          A. I looked at a number of Oil Conservation Division  
17 things.

18          Q. You didn't find them?

19          A. No.

20          Q. How about New Mexico Tech? Did you look there?

21          A. No. I didn't look at New Mexico Tech.

22          Q. So you don't know whether those oil and gas sites  
23 that exist contributed to your parameters concerning -- you  
24 can't say. Can you?

25          A. Well, I don't -- they weren't listed here. And I

1 can't tell you on the basis that logic that Santa Claus isn't  
2 contributing to this thing.

3 Q. We're not going to blame Santa Claus --

4 A. Pardon?

5 Q. We're not going to blame Santa Claus here, are  
6 we?

7 A. And I don't think at this point you can blame oil  
8 and gas wells either.

9 Q. Right. You referred to a number of releases from  
10 the state of Colorado over several years?

11 A. Right.

12 Q. When you looked at that data, did you have the  
13 opportunity the look at volumes involved with each of those?

14 A. It was -- I didn't look at it, no. I mean,  
15 there's 900 and some of those. I didn't look at that. There's  
16 a lot of tabular data that's available there. And my thrust  
17 here was just to establish that there are some hazards within  
18 that hazard threat box, and nothing more. It's not meant to be  
19 a composite or exhaustive list of what has happened in Colorado  
20 nor New Mexico.

21 Q. Right. You're simply saying that there appears  
22 to have been contaminants and toxic substances involved in  
23 these spills. You don't go so far as to say they resulted in  
24 any sort of harm?

25 A. I don't remember them coming up with any actual

1 effects. I'm trying to think here.

2 Q. Okay. But you had another slide. You had an  
3 inventory of contaminants and toxic substances from the oil and  
4 gas industry. We don't need to go three, but let me ask you  
5 if --

6 A. Well, let's look at it.

7 Q. Well, let me ask you a question: Did you compile  
8 an inventory of contaminants and toxic substances from land use  
9 activities outside of the oil and gas industry?

10 A. Not here, no.

11 Q. Okay. Do you have an opinion whether drilling  
12 these wells on a closed-loop system is a good way to minimize  
13 the risk?

14 A. I hate -- I'm not an expert in the oil industry,  
15 you know. I've done some evaluations both in Argentina and  
16 other places, but I'm not an expert on the actual physical  
17 engineering and things like that. So I would really hesitate  
18 to start venturing into that. I did read a couple of articles  
19 on closed-loop systems where the amount of material is  
20 substantially less and the chance for spills is less. But I'm  
21 paraphrasing what I read in that article, and I don't know.

22 MR. HALL: No further questions.

23 MR. BROOKS: Okay. Any redirect?

24 MR. A. TRUJILLO: No, Mr. Hearing Examiner.

25 MR. BROOKS: Very, good. In that case, we will

1     excuse the witness, and we will adjourn for the evening, unless  
2     there is something of an immediate nature that needs to be  
3     raised prior to our reconvening tomorrow.

4             MR. T. TRUJILLO:   Mr. Examiner, how much time --

5             UNIDENTIFIED PUBLIC MEMBER:   You didn't announce when  
6     the meeting starts.

7             MR. BROOKS:   Okay.   I'm responding to two people.   I  
8     will respond to Mr. Trujillo first because he's the first one I  
9     heard.

10            The County has 1 hour, 15 minutes remaining.  
11   Approach has 4 hours, 38 minutes remaining.

12            MR. A. TRUJILLO:   Mr. Hearing Examiner, if I may, I'm  
13   going to lodge an objection at this point that you adhere to  
14   these time limits, because I believe that they will violate the  
15   County's fundamental rights to due process to adequately  
16   respond.

17            We're dealing with a case where we've already heard  
18   expert testimony from two witnesses.   On Monday, we're going to  
19   hear expert testimony from probably a minimum of two, maybe  
20   three more.   So to hold the County to a cross-examination of  
21   two or three expert witnesses, not to mention two or three  
22   other fact witnesses, in an hour and 15 minutes will  
23   fundamentally violate the County's rights to due process in  
24   this matter.

25            MR. BROOKS:   Thank you, Mr. Trujillo.   I will advise

1 you, however, that the time lines were set at the beginning of  
2 the hearing and everyone had equal knowledge of them, and I  
3 believe that that accords with due process. So I will overrule  
4 your objection. Anything further before we adjourn?

5 MR. HALL: No, sir.

6 MR. BROOKS: Very good. We will stand adjourned  
7 until 11:00 a.m. on Monday, June 23rd. The reason for the  
8 11:00 a.m. hour is that is as early as this room is available.  
9 When you arrive here, this room may be in use. If so, we may  
10 have to wait in the hall for awhile. However, they had only  
11 reserved it until 11 o'clock. So we should be able to run them  
12 out soon.

13 We stand adjourned.

14 [Adjournment at 5:40 p.m., to reconvene at 11:00 a.m.  
15 on June 23, 3008.]
