PRODUCTION ALLOCATION METHODOLOGY

New Drill Wells & Recompletions

Initially Subtraction Method followed by Fixed Allocation (Ratio) Method

Subtraction Method (Six to Twelve Months)

- Determine stabilized flow rate for existing zone (for recompletion decline curve) or lower zone (for new drill – initial stabilized rate) and forecast production rate by month
- Subtract forecasted rate from commingled rate to determine production rate on new commingled zone
- Utilize subtraction method for six to twelve months until new zone rate stabilizes, then utilize fixed allocation method with current rates

Fixed Allocation Method (after Subtraction Method)

- Utilize forecasted rate for existing or lower zone
- Calculate upper zone rate by subtracting existing or lower zone rate from commingled rate
- Lower zone allocation = <u>Lower zone rate</u>
 Commingled rate
- Upper zone allocation = (Commingled rate Lower zone rate) / Commingled rate
- Example: Lower or existing zone rate 400 MCFD (forecast after 6 to 12 months)
 Commingled rate 1000 MCFD

Lower zone allocation = 400 / 1000

= 40%

Upper zone allocation = (1000-400) / 1000

= 60%
