DETAILS OF WORK

(State names of and expected depths to objective sands; show sizes, weights, and lengths of proposed casings; indicate mudding jobs, cementing points, and all other important proposed work)

As per N.M.D.C.C. Order No. B-340 dated 4-15-52, it is proposed to drill complete the subject well in such a manner as to permit production of oil from the Geyburg formation and gas from the Wash formation.

Proposed manner of dual completion is as follows:

- (1) Pull tubing and run Radioactivity survey.
- (2) Set Baker model "D" retainer production packer at approximately 3660' in the 5 1/2" casing which is set at 349'.
- (3) Perforate and test Wash formation between 3400' and 3550'.
- (4) Run tubing set in model "D" packer so as to prevent the co-mingling of gas or oil produced from either formation. Oil and gas from the Geyburg is to be produced thru the tubing and gas from the Wash is to be produced through the annulus between the tubing and 5 1/2" casing.

Your permission is requested to accomplish the dual completion as proposed.

I understand that this plan of work must receive approval in writing by the Geological Survey before operations may be commenced.
