Re: Caulkins Oil Co. Well T-123

Gentlemen:

Caulkins Oil Company Well T-123 is located 700' from the North Line and 1800' from the East Line, Section 7-26N-6W, Rio Arriba County, New Mexico. This well was drilled to a total depth of 6845' and completed in the Tociito formation December 1, 1953. Seven inch casing was set at 6843' and cemented with 200 sacks of cement.

It is our desire to deepen this well to approximately 7500' and make a completion in the Dakota formation. This would be accomplished by running a 5-1/2" O.D. liner from the bottom of the 7" casing to the new total depth. With the approval of the Conservation Commission, we propose to inject water into the Tociito formation through the casing tubing annulus, and produce the Dakota gas formation through production tubing. We are planning this water injection as a cooperative project with El Paso Natural Gas Products Company, using their Rincon #11 well for water injection.

As you know, the field rules for the Dakota formation require that a well be located at least 750' from the outer boundary lease lines. In order for us to perform this work we are requesting that El Paso Natural Gas Company consent to this proposed location.

We would appreciate receiving a letter from your company stating that you have no objection to our deepening and producing our T-123 well from the Dakota formation.
