Secretary-Director

*Case 9685*

Re: Non-Standard Location  
MM Federal Com. No. 10  
330' FNL & 330' FEL  
Sec. 35-T9S-R25E  
Chaves County, New Mexico

Dear Sir:

McClellan Oil Corporation respectfully requests an administrative approval for an non-standard location for geologic reasons.

As shown on the enclosed Abo Gross Sand Isopach Map, the preferred location of 660' FNL & 660' FEL is a poor location with less than 10' of sand and would result in a dry hole or non-commercial well. The existing location (330' FNL & 330' FEL) would encounter 15' of sand and can be expected to be a good commercial producer.

The MM Federal No. 2 is located just south, and in the same 160 acre proration unit as the MM Federal Com. No. 10 well and was drilled in 1983. This well was Plugged & Abandoned in 1986 after producing only 8050 MCFG.

McClellan Oil Corporation requests that you approve our request for a non-standard location in order to provide us an opportunity to fully develop this proration unit.

Enclosed please find a copy of the lease map showing the offset lease operator who has been notified of our request by certified mail, along with a waiver stating no objections.

Formations we expect to penetrate are the San Andres, Glorieta, Yeso and Abo.

If you have any questions or comment, please call me at (505) 622-3200.

Sincerely,

*Mark McClellan*

Mark McClellan  
Geologist
