

STATE OF NEW MEXICO  
ENERGY, MINERALS AND NATURAL RESOURCES DEPARTMENT  
OIL CONSERVATION COMMISSION  
STATE LAND OFFICE BUILDING  
SANTA FE, NEW MEXICO

8 June 1988

EXAMINER HEARING

IN THE MATTER OF:

Application of Northwest Pipeline Corp- CASE  
oration for salt water disposal, Rio 9401  
Arriba County, New Mexico.

BEFORE: David R. Catanach, Examiner

A P P E A R A N C E S

For the Division:

Robert G. Stovall  
Attorney at Law  
Legal Counsel to the Division  
State Land Office Bldg.  
Santa Fe, New Mexico

For the Applicant:

Paul Cooter  
Attorney at Law  
RODEY, DICKASON, SLOAN,  
AKIN & ROBB, P.A.  
P.O. Box 1357  
Santa Fe, New Mexico 87504

## I N D E X

## PAUL THOMPSON

NW Exhibit One, Map 6

NW Exhibit Two, Letter 7

NW Exhibit Three, Wellbore Diagram 10

NW Exhibit Four, Water Samples 12

NW Exhibit Five, Structure Map 20

NW Exhibit Six, Water Analysis 22

NW Exhibit Seven, Cross Section 23

1 MR. CATANACH: Call next Case  
2 Number 9401.

3 MR. STOVALL: Application of  
4 Northwest Pipeline Corporation for salt water disposal, Rio  
5 Arriba County, New Mexico.

6 MR. CATANACH: Are there ap-  
7 pearances in this case?

8 MR. COOTER: Paul Cooter, with  
9 the Rodey Law Firm in Santa Fe, appearing for the appli-  
10 cant, Northwest Pipeline Corporation.

11 I have two witnesses that need  
12 to be sworn but before I do that I would like to point out,  
13 I believe in the third line of the docket that commences  
14 with words "injection pressure", the word "not" should  
15 appear at that point.

16 MR. CATANACH: That changes  
17 the whole meaning.

18 MR. COOTER: Well, I believe  
19 not in excess of the 0.2 psi per foot is the standard and  
20 anything in excess of this would only come after a step  
21 rate test and --

22 MR. STOVALL: My initial  
23 inclination would be that -- that the erroneous advertis-  
24 ing would not give -- harm anybody's notice or right to be  
25 heard. They would be more inclined to come as it was ad-

1     vertised than they would be if it had been advertised  
2     correctly, I would think. That would be my initial im-  
3     pression.

4                             MR. COOTER: I agree with you.  
5     I agree with you.

6                             MR. CATANACH: I concur on  
7     that. I don't think we need to readvertise it, Paul, just  
8     go ahead and give your testimony.

9                             MR. COOTER: We have two  
10    witnesses, as I mentioned, to be sworn, Paul Thompson and  
11    Mike Murphy.

12                            MR. CATANACH: Will the wit-  
13    nesses please stand?

14  
15                            (Witnesses sworn.)

16  
17                            PAUL C. THOMPSON,  
18    being called as a witness and being duly sworn upon his  
19    oath, testified as follows, to-wit:

20  
21  
22                            DIRECT EXAMINATION

23    BY MR. COOTER:

24                            Q            Would you state your name for the re-  
25    cord, please, sir?

1           A           My name is Paul Thompson.

2           Q           And by whom are you employed, Mr.  
3 Thompson?

4           A           I'm employed by Northwest Pipeline in  
5 Farmington, New Mexico.

6           Q           What is your position with the company?

7           A           I'm currently the Manager of Production  
8 and Drilling for Northwest.

9           Q           Very briefly, would you relate your  
10 education and professional experience?

11          A           I received a Bachelor of Science in  
12 Chemical Engineering from New Mexico State in 1976.

13                    I worked for three years for Phillips  
14 Petroleum in Bartlesville, Oklahoma.

15                    I started as a drilling engineer for  
16 Northwest Pipeline in 1979 and I'm a Registered  
17 Professional Engineer in the State of New Mexico.

18          Q           What does Northwest Pipeline seek by its  
19 application in this case?

20          A           Northwest Pipeline seeks authority to  
21 dispose of water produced in conjunction with Fruitland  
22 coal wells into the Mesaverde formation of our Rosa Unit  
23 No. 95 -- 94 Well.

24                    We previously filed a C-108 asking for  
25 administrative approval in this case.

1 Q And then that was set for hearing today.

2 A That's correct.

3 Q That Rosa Unit No. 94 Well was drilled  
4 when, Mr. Thompson?

5 A It was spudded in October of 1982.

6 Q And was it completed as a producer?

7 A No, sir. We tested the Mesaverde form-  
8 ation and were unable to sustain production.

9 Q And then temporarily plugged?

10 A It's been temporarily abandoned, not  
11 plugged.

12 Q Let me direct your attention to what has  
13 been marked as Exhibit Number One in front of you. Would  
14 you locate the Rosa Unit No. 94 Well?

15 A Yes, sir, the 94 Well is at the center  
16 of the two concentric circles. This map outlines the en-  
17 tire Rosa Unit with Northwest's acreage shaded.

18 The smaller circle is the one-half  
19 radius circle evolving from the 94 Well. The larger circle  
20 is a 2-mile radius.

21 Q What other operators or working interest  
22 owners are -- are -- own interests within that one-half  
23 mile circle?

24 A Northwest Pipeline is the operator of  
25 all the formations within the Rosa Unit. In this particu-

1 lar drilling block, the west half of Section 16, Amoco Pro-  
2 duction and Northwest Pipeline own the mineral rights to  
3 the Mesaverde 50/50.

4 Q Who paid for the drilling of that Rosa  
5 Unit No. 94 Well?

6 A Due to a land mistake on Northwest Pipe-  
7 line's part, Northwest Pipeline paid for 100 percent of the  
8 drilling and completion costs of the Rosa 94.

9 Q And that's even though Amoco has a half  
10 interest in -- in the Mesaverde formation.

11 A That's correct. Actually we invoiced  
12 Amoco for their 50 percent and they paid it and we reim-  
13 bursed them for that -- their share of the monies by mis-  
14 take.

15 Q Let me hand you what has been marked as  
16 Exhibit Number Two. That's the -- would you identify what  
17 has been marked as Exhibit Number Two, please sir?

18 A This is a letter that went to all the  
19 working interest owners of the Rosa Unit. It's a supple-  
20 mental 1988 drilling program that was filed with the regu-  
21 latory agencies which outlines our Rosa Unit development,  
22 which consisted of the three Fruitland coal wells; in addi-  
23 tion outlines our plans to convert the Rosa Unit 94 into a  
24 water disposal well.

25 Q Now under your -- your unit arrangement,

1 the unit agreement, does Amoco have an interest in the  
2 Fruitland coal wells that will be drilled?

3 A In the first initial three coal wells,  
4 they do not have any working interest in those.

5 Q That's the ones that are mentioned in  
6 your plan of development?

7 A That's correct.

8 Q That also outlines your plan to convert  
9 the Rosa Unit No. 94 Well to a water disposal well.

10 A That is correct.

11 Q Is it necessary -- was -- was a copy of  
12 -- of this supplemental 1988 drilling program mailed to  
13 Amoco?

14 A That's correct. This letter was mailed  
15 to Amoco via certified return receipt requested mail, as it  
16 was to all the other working interest owners.

17 Q Was it -- did it receive a return  
18 receipt from Amoco?

19 A In this case we did not receive that. On  
20 verbal conversations with the Amoco people, they say that  
21 they received the letter on May 17th of this year.

22 Q And just from some post office foul up  
23 the return receipt has not been received.

24 A Evidently, if we received the return  
25 receipts from all the other working interest owners, with

1 the exception of Amoco.

2 Q Is this Federal land?

3 A That's correct. This is the -- the  
4 minerals here are owned by -- originally leased by the  
5 Federal Bureau.

6 Q Have you been in contact with the Bureau  
7 of Land Management to obtain its approval?

8 A That's correct. We filed an NCL-2-B  
9 application, which is their authorization to -- to inject  
10 water.

11 I received verbal notice that they have  
12 approved that and that should be signed off next Monday.

13 Q Has not yet been returned to Northwest.

14 A That's correct.

15 Q Let me then direct your attention to --  
16 how about the surface owner?

17 A The surface owner of -- of land where  
18 the 94 is located is the U. S. Forest Service. We have  
19 taken them out to inspect the site and they've given us  
20 some surface stipulations, but they don't really have any  
21 problem at all with our surface facility.

22 Q Before this can be affected, you not  
23 only have to obtain the BLM approval but -- but also appro-  
24 val from the other working interest owners in the Rosa  
25 Unit.

1           A           That's correct. Before we can inject  
2 actually, we need -- our authority to inject is contingent  
3 upon approval from the NMOCD, the BLM, the surface owners,  
4 and the other working interest owners involved in this 94  
5 Well.

6           Q           Let me now direct your attention to what  
7 has been marked as Exhibit Number Three, which is a well-  
8 bore diagram.

9                       What are the future plans for the con-  
10 version of this Rosa Unit No. 94 Well if the application be  
11 granted?

12          A           Let me first describe the wellbore  
13 diagram here.

14          Q           All right, sir.

15          A           And then I'll get into your question  
16 next.

17                       The -- starting at the top we set  
18 9-5/8ths casing in a 13-3/4-inch hole and circulated cement  
19 to surface. That should cover any potentially fresh water  
20 zones near the surface, even though there no fresh water  
21 wells in the area.

22                       We then drilled an 8-3/4-inch hole, set  
23 7-inch casing and cemented that and the top of cement by  
24 temperature survey is 2000 feet, which covers our estimated  
25 Ojo Alamo top.

1                   We then drilled a 6-1/4-inch hole with  
2 gas to our -- our total depth and ran a 4-1/2-inch liner.  
3 Our perforation interval is from 5360 to 5681. We shot 22  
4 holes.

5                   We stimulated the Mesaverde well with  
6 80,000 pounds of 20/40 sand and slick water and after ex-  
7 tensive swabbing operations we were unable to sustain gas  
8 production and the well was never tied to the pipeline;  
9 subsequently temporarily abandoned.

10                  What we propose to do to covert this  
11 well to an injection facility is to reperforate in the same  
12 interval, just more holes, just to decrease the pressure  
13 drop through the pipe and also to change our 2-3/8ths-inch  
14 tubing to 2-7/8ths, again just to reduce our pressure drop.

15                  We plan on injecting under a packer; on  
16 the diagram I've shown a Geiberson Unit Packer of 6, which  
17 can hold pressure from either direction.

18                  We plan on loading the back side with a  
19 packer fluid.

20                  Based on Meridian's experience with  
21 their 30-N-6 112-Y, we plan on treating the water with a  
22 corrosion inhibitor and bactericide and for that reason we  
23 don't feel like the tubing will need to be plastic-lined.

24                  Q           How about treating the proposed -- the  
25 produced water to be disposed of?

A            That's right, at each one of the proposed Fruitland wells we plan on injecting -- or treating the water with corrosion inhibitor and bactericide.

Q All right, what about the -- what are your future plans, the initial amounts and the pressures?

A                    We initially plan to drill 3 Fruitland wells and dispose of the water into the 94, and we're just estimating based on Meridian's experience in the 30-N-6 Unit that we may -- we need to expect possibly 1000 barrels of water per well, so our initial rate is estimated to be at 3000 barrels.

Based on, you know, several fracs in the area, I don't really anticipate exceeding our .2 psi per per foot injection limitation. If that should be come necessary, then we'll run a step rate injection test to determine what the maximum rates and/or pressure can be.

Q Let me direct your attention to what has been marked as Exhibit Number Four. Would you identify that?

A Exhibit Number Four are three water samples, the first one being from the Rosa 94 Mesaverde formation, which is our proposed injection well, showing a total dissolved solids level of 45,664 milligrams per liter.

The second one is the Rosa Unit 45,

1 which is a Mesaverde offset to the north, which shows total  
2 dissolved solids of 31,477 milligrams per liter.

3 The third water analysis is a sample of  
4 Fruitland coal water, which we hope will be representative  
5 of the type of water we expect to produce with our Fruit-  
6 land well. We obtained this from Meridian in the 30-N-6  
7 Unit, which shows total dissolved solids of 17,500 milli-  
8 grams per liter.

9 You'll notice that the bicarbonate level  
10 is rather high in this water sample, which is kind of  
11 typical of Fruitland coal water.

12 But in any case, the Fruitland coal  
13 water appears to be a better quality than the Mesaverde  
14 water.

15 Q One thing I'm not sure we covered, let  
16 me go back to Exhibit Number One and have you identify any  
17 other wells within this half mile circle.

18 A I'm sorry. There are only two wells  
19 listed in our half mile area of interest, the first one  
20 being the Rosa 941

21 The other one is a Penrose and Tatum No.  
22 3 Well, which is called the Rosa No. 3 Well, which was  
23 drilled through the Pictured Cliff, tested in the PC, and  
24 subsequently plugged and abandoned. So it does not pene-  
25 trate the Mesaverde formation. Those are the only two

1 wells drilled within our half mile radius.

2 Q Was that No. 3 Well a -- a Northwest  
3 Pipeline well?

4 A It was -- it was drilled by Penrose and  
5 Tatum. The name was changed after the unit was estab-  
6 lished.

7 Q Okay. Mr. Thompson, in your opinion  
8 would the granting of this application by the Commission  
9 prevent waste?

10 A Yes.

11 Q Protect correlative rights?

12 A Yes.

13 Q Anything else you want to add? Have we  
14 covered everything?

15 A I would think so.

16 MR. COOTER: That concludes  
17 our direct examination.

18

19 CROSS EXAMINATION

20 BY MR. CATANACH:

21 Q Mr. Thompson, you've identified the Ojo  
22 Alamo as being from approximately 2354 down to 2799, is  
23 that correct?

24 A Actually these figures here are just the  
25 formation tops.

1 Q And --

2 A We didn't --

3 Q -- to your knowledge there are no water  
4 wells within a half mile of your well?

5 A There is really no water wells within  
6 two miles of this area.

7 Q There are no water wells? Was the Well  
8 No. 94 tested in all three different zones in the Mesa-  
9 verde, the Point Lookout, the Menefee, and the Cliff House?

10 A That's correct, it was.

11 Q And was found to be nonproductive in all  
12 three zones?

13 A Right.

14 Q Do you know of any -- any Mesaverde pro-  
15 duction in this general area that may be affected?

16 A Mr. Murphy is going to discuss the  
17 offset production in more detail later.

18 The Rosa 45 Well is a marginal, non-  
19 commercial producer to the north and the Rosa 85 off to the  
20 southwest is a Mesaverde producer. He'll discuss those  
21 issues with you.

22 Q Okay. The analysis that you provided  
23 from the Mesaverde formation, is there any way of knowing  
24 where that came from, or to your knowledge is the water  
25 quality in Cliff House, the Menefee, and Point Lookout

1 essentially the same?

2 A Be unable to tell since all three  
3 formations are open in both wells. This is just water that  
4 was produced to the surface or swabbed out of the well, so  
5 I'd be unable to tell each -- each different interval.

6 Q Mr. Thompson, is it your understanding  
7 that the produced water that's produced in conjunction with  
8 the coal, that the more you produce, the worst quality it  
9 becomes? Is that your understanding? And it deteriorates;  
10 the quality of the water deteriorates the more you produce  
11 out of the formation?

12 A I'm not aware of that, no.

13 Q I had heard that. I just wondered if  
14 you were familiar with it.

15 A These are our -- will be our first  
16 Fruitland wells, so we don't really have much experience  
17 other than what we've gleaned from other operators.

18 Q Okay. Tell me how your corrosion in-  
19 hibitors will help you out and eliminate the need for  
20 coating the tubing.

21 A The main corrosion element in the water,  
22 well with the gas produced from Fruitland coal wells, makes  
23 a higher quantity of CO<sub>2</sub> than normal. The CO<sub>2</sub> when it  
24 mixes with water causes carbonic acid and when that's in  
25 the water it could cause some corrosion problems.

1                   We plan on -- on pumping the water from  
2 the producing wells over to our water disposal so we plan  
3 on adding corrosion inhibitor at the Fruitland well sites  
4 with bactericide and keep this as a closed system all the  
5 way through our injection. That was we're going to protect  
6 our surface pipelines as well as the 94 Well casing.

7                   By having a packer in the well here,  
8 we're going to be able to monitor the pressure on that  
9 annular space and so we'll be able to know right away for  
10 -- if our packer integrity or we have any kind of a leak  
11 from below, since we will be injecting under pressure.

12                  Q           Okay, even though you're going to add  
13 the corrosion inhibitor you're still going to solids in the  
14 water that cause some corrosion problems.

15                  A           Well, we're going to filter out the  
16 water at the -- at the location on each one of the Fruit-  
17 land sites, plus filter it down to one or two microns be-  
18 fore it goes downhole. I don't think that we'll have much  
19 solids problem.

20                               MR. CATANACH:   That's all I  
21 have of the witness.

22  
23                               MICHAEL J. MURPHY,  
24 being called as a witness and being duly sworn upon his  
25 oath, testified as follows, to-wit:

## 1 DIRECT EXAMINATION

2 BY MR. COOTER:

3 Q Would you state your name for the re-  
4 cord, please, sir?

5 A Yes, sir. My name is Michael J. Murphy.

6 Q By whom are you employed, Mr. Murphy?

7 A I'm currently employed by Northwest  
8 Pipeline.9 Q And what's your position with the com-  
10 pany?

11 A As a reservoir engineer.

12 Q Would you please briefly relate your  
13 education and professional experience?14 A Yes. I received a Bachelor of Science  
15 degree in geological engineering and a Bachelor of Science  
16 degree in civil engineering, both June, 1978, both from New  
17 Mexico State University.18 I've worked -- I worked immediately  
19 after school for Texaco, Incorporated, for two years as a  
20 production engineer, two area offices in west Texas, both  
21 within the Midland District.22 August of 1980 I went to work for North-  
23 west Pipeline in their Drilling and Production Office in  
24 the San Juan Basin, Farmington, as a Production and  
25 Drilling Engineer, and which I was the net 4-1/2 years.

1                   In January of 1985 I was transferred to  
2 Salt Lake City Office for Northwest Pipeline as a reser-  
3 voir engineer. My responsibilities as a reservoir engineer  
4 are currently in -- are in the San Juan Basin, which  
5 includes the Rosa Unit.

6                   Q           You've heard the testimony of Mr.  
7 Thompson. Please identify the proposed injection zone, the  
8 formation and the depth.

9                   A           The proposed injection zone would be  
10 from 5360 to 5681, which are the current perforations --  
11 perforated interval.

12                               The injection zone will be the Lower  
13 Cliff House sandstone, the Menefee formation, the Point  
14 Lookout sandstone. All three of these are members of the  
15 Mesaverde Group.

16                               The top of the Cliff House occurs at  
17 5120; top of the Menefee formation occurs at 5386; the top  
18 of the Point Lookout formation occurs at approximately  
19 5550. The total thickness of the entire Mesaverde Group in  
20 this area is approximately 800 feet.

21                   Q           The depth of the proposed injection zone  
22 would then be -- what would be the top and what would be  
23 the bottom?

24                   A           Yes, sir. The perforated interval is  
25 currently open, 5360 to 5681, which would include the Lover

1 Cliff House, Menefee, and Point Lookout.

2 Q Briefly explain the lithology of the --  
3 of the zones.

4 A A brief overview of the lithology would  
5 be the Cliff House formation is primarily interbedded  
6 sandstones and transgressive marine sandstones.

7 The Menefee formation includes interbed-  
8 ded sandstones, shales and thin coals deposited with a --  
9 or in a Continental environment.

10 The Point Lookout formation being prim-  
11 arily a regressive marine sandstone interbedded with some  
12 siltstones.

13 Q Let me direct your attention, if I may,  
14 Mr. Murphy, to the -- what we have marked as Exhibit Number  
15 Five in front of you. Would you identify that?

16 A Yes, sir. This is a structure of the C  
17 marker horizon which is a marker within the Lewis Shale  
18 within the Rosa Unit.

19 Because of the transgressive, regressive  
20 nature of the -- of the Mesaverde Group, it's a common geo-  
21 logic practice within our organization to use the C marker  
22 as a marker for the structure determination for the Mesa-  
23 verde Group. It -- the Lewis Shale overlies the Mesaverde  
24 Cliff House.

25

1           Q           Is there any evidence of any open faults  
2 between the injection zone and either the overlying or  
3 underlying aquifers?

4           A           No, sir. According to this structure  
5 map, other structure maps, other formations, and surface  
6 geology maps, there are no indications of open faults  
7 between the Mesaverde injection zone and any overlying or  
8 underlying aquifers and no other type of hydrologic con-  
9 nections are known.

10          Q           That is, hydrologic connections between  
11 the injection zone and the aquifers, either above or be-  
12 low?

13          A           That's correct, sir.

14          Q           What are the underground aquifers in  
15 this area?

16          A           The known aquifers overlying the pro-  
17 posed injection zone include the -- the San Jose, the Naci-  
18 omento, the Ojo Alamo formations, the Ojo Alamo being the  
19 -- some 2700 feet above the Cliff House, which would be the  
20 immediately above the Kirtland formation, I believe.

21          Q           Do you have the depths of those?

22          A           Yes, sir, it's approximately 2370 feet.  
23 The Nacioment, which would be overlying the Ojo Alamo,  
24 which would be from 1520 to approximately 2370, and the San  
25 Jose, which is the surface formation from zero to 1520

1 feet.

2 Q So the deepest underground aquifer  
3 overlaying the proposed injection zone would be the Ojo  
4 Alamo, which would have a depth of approximately what?

5 A Yes, sir, of 2370 feet, approximately.

6 Q Are there any known water wells in the  
7 area of review?

8 A No, no known water wells exist in the  
9 area of review.

10 Q Are there any aquifers underlying the  
11 proposed injection zone, to your knowledge?

12 A To my knowledge there are no aquifers  
13 immediately underlying the injection zone.

14 Q Okay. Let me hand you what has been  
15 marked as Exhibit Number Six for this hearing. Would you  
16 identify that?

17 A Yes, sir, this is a water analysis that  
18 we've obtained from Meridian Oil on their San Juan Unit,  
19 30-6 Unit, Well No. 58-A, which is about the closest well  
20 we could find from our proposed Rosa Unit 94 injection well  
21 that has a test of the Ojo Alamo waters.

22 The -- the analysis shows that in this  
23 case, that the first test shows greater than 10,000 parts  
24 per million total dissolved solids. The second page to  
25 that exhibit is a later test on the same well and that

1 shows 12,850 total dissolved solids.

2                   What we're trying to do here is point  
3 out that in this area the Ojo Alamo is greater than at  
4 10,000 parts per million definition of fresh water.

5           Q           I think we're ready to go to this, are  
6 we not?

7           A           Yes.

8           Q           Let me direct your attention, then, to  
9 what has been marked as Exhibit Number Seven. Would you  
10 identify that?

11          A           Yes, sir. Exhibit Number Seven is a  
12 simple cross section we've put together showing the  
13 adjacent Mesaverde, well, actually it's the adjacent  
14 off-setting wells to this proposed water injection -- water  
15 disposal well, Rosa Unit No. 94. The small map at the  
16 bottom indicates the cross section from the Rosa Unit 94 in  
17 the southwest quarter of Section 9 of 31 North, 5 West. It  
18 includes the Rosa Unit 65 Well, which is not completed in  
19 the Mesaverde. It is a Dakota, deeper Dakota, Basin Dakota  
20 formation producer. It was logged across the Mesaverde  
21 interval.

22                   The cross section also includes the Rosa  
23 Unit No. 94, the subject well, and also in Section 20, the  
24 northeast quarter, Rosa Unit No. 85, which is a Mesaverde  
25 producer.

1                   Also this is our attempt to correlate --  
2 correlate the sands within the Mesaverde Group to -- what  
3 we've tried to show here is the quality. Also, the shaded  
4 intervals are what we consider to be net pay within each  
5 individual well, the net pay basis being 80 percent water  
6 saturation or less.

7                   Q           Are the Mesaverde wells in the area  
8 productive?

9                   A           Okay, We might refer to one of the  
10 other larger maps, either Exhibit Five or Exhibit One,  
11 either one.

12                  Q           All right.

13                  A           Basically within the half mile radius  
14 area of concern there are no other productive intervals,  
15 the 95 being deemed noncommercial.

16                               The Rosa 45 is an immediate offset,  
17 north and southwest quarter of Section 9. It is  
18 productive. It was deemed noncommercial. The pipeline was  
19 connected to the well.

20                               The No. 94 would be the -- a southwest  
21 offset by some 3800 feet, would be the Rosa Unit No. 85 in  
22 the northeast corner of Section 20 of 31 North, 5 West.  
23 Its deliverability is currently about 100 MCF a day.

24                  Q           In your opinion, Mr. Murphy, might the  
25 injection water help maintain that reservoir pressure and

1 aid in the recovery of the current reserves assigned to the  
2 producing wells?

3 A Yes, sir, we believe it will. Let me  
4 state this, and you can refer to Exhibit Five. We have  
5 several dry holes which I believe would show that the -- we  
6 are at the edge of a productive to nonproductive area, the  
7 Mesaverde area of this Rosa Unit.

8 In Section 8 is a dry hole, the No. 46,  
9 which was drilled by El Paso Natural Gas. It was swabbed  
10 100 percent water, tested 100 percent water, in the Mesa-  
11 verde.

12 The Rosa Unit No. 94, which is Section 9  
13 to the north, it was also tested 100 percent -- well,  
14 swabbed -- being noncommercial in the Mesaverde.

15 The Rosa Unit No. 40, which would be in  
16 Section No. 11 of the same township, that was also a Mesa-  
17 verde deemed 100 percent water wet.

18 And, of course, the Rosa Unit No. 94.

19 Another thing I might point out is that  
20 the pressure, shut-in pressures within the Mesaverde reser-  
21 voir currently are between 1400 and 1500 psi and around the  
22 Rosa No. 94, Rosa No. 95, and they're quite a bit lower to  
23 the east and around the Rosa Unit No. 85, which I believe  
24 is somewhere like 580 psi.

25 Therefore, we do believe that the in-

1       jection of the water into the Unit No. 94, because of the  
2       favorable mobility ratio between the water and gas, we  
3       expect a bank of the injection water radiating around from  
4       the 94 to displace any gas that there is there ahead of it  
5       towards the more productive area within the Mesaverde Rosa  
6       Unit, which would be towards the west.

7                       It also should help the -- the injection  
8       water should help maintain reservoir pressure at those  
9       producing wells, hopefully, to increase the current de-  
10      liverabilities or maintain the current deliverabilities in  
11      those producing wells.

12               Q           Mr. Murphy, have you calculated the  
13      total amount of water that could be injected into the  
14      Mesaverde within the 1/2-mile radius shown on the Exhibit  
15      Five?

16               A           Yes. The total voidage using volumetric  
17      calculations and just dealing with the gas saturation  
18      calculated out to be approximately 3.5-million barrels be-  
19      fore fill-up. That's again using the 1/2-mile radius, and  
20      consequently, at our proposed estimated 3000 barrels of  
21      water a day would be somewhere in the neighborhood of 3.5  
22      years.

23               Q           Have you discussed these plans with  
24      Amoco?

25               A           Yes, sir. As Mr. Thompson, I believe,

1 pointed out, the two reservoir engineers out of Amoco's  
2 Denver office talked with me over the telephone, I believe  
3 June 2nd, June 3rd, about the concern they had with the  
4 injection into the Mesaverde. They said they hadn't had a  
5 chance to evaluate the production in the offsetting ac-  
6 reage.

7 Q During those conversations with the  
8 Amoco people in Denver, did they confirm receipt of the  
9 1988 plan of development that was previously mentioned?

10 A Yes, sir. I asked one of the reservoir  
11 engineers, Jeff Elkin, who is responsible for the Mesaverde  
12 formations in this area, and he told me that he received it  
13 on the 17th of May.

14 Q That, so the record will be clear,  
15 that's what we have marked as Exhibit Number Two?

16 A Yes, sir, that's correct.

17 Okay, one more thing I would like to  
18 add, on the Exhibit Number Five, which is the structure  
19 map, it's plain to see that our Rosa No. 94 is down dip  
20 from the Rosa Unit No. 85, also in the offsetting acreage  
21 that's undeveloped, such as 17, Section 17, which is a  
22 textbook -- I think gravity would help us in that sense by  
23 pushing the gas up dip, which is where the producing wells  
24 are.

25 Also, on the cross section, I apologize

1 for going back and forth here, but the cross section,  
2 Exhibit Number Seven, clearly shows the difference of net  
3 pays between our proposed injection well; also, and the  
4 Rosa Unit No. 85, which would be the closest producing,  
5 current producer.

6 Also, in Section 17, the undeveloped  
7 acreage immediately west offsetting the No. 94, the Rosa  
8 Unit No. 65, the log clearly shows that by our calculations  
9 anyhow, that there's a very small amount of net pay; there-  
10 fore probably it would be noncommercial in that area and  
11 therefore we don't feel like we would damage the reserves.

12 Q That take care of it?

13 A Yes.

14 MR. COOTER: We offer Exhibits  
15 One through Seven, which have been discussed by the two  
16 witnesses.

17 MR. CATANACH: Exhibits One  
18 through Seven will be admitted as evidence.

19 MR. COOTER: That concludes  
20 our direct examination of this witness.

21  
22 CROSS EXAMINATION

23 BY MR. CATANACH:

24 Q About how long do you anticipate in-  
25 jecting into this well? You said it would take you 3-1/2

1 years to fill up.

2 A It's my understanding of corporate -- my  
3 immediate supervisors, supervisor has talked it over with  
4 me, I understand that this is an initial valuation of the  
5 Fruitland area. I believe he's satisfied with this time  
6 period, although I think it's his opinion that he would  
7 prefer not to set this in stone but if we can evaluate this  
8 area within this amount of time, I think we'll know which  
9 way we need to go from here, as far as other disposal areas  
10 or whatever we need to be done.

11 Q Couldn't it be possible that -- that in  
12 the 3-1/2 year period that you will inject this, that you  
13 -- you may deplete the Mesaverde around this area? Is that  
14 possible?

15 A By depleting I don't know --

16 Q Well, produce the wells to an economic  
17 limit.

18 A In the surrounding wells?

19 Q Yeah.

20 A The -- we project on the Rosa No. 85,  
21 it's produced somewhere in the neighborhood of 250 MM to  
22 date, and we project out over the next 20 years, approxi-  
23 mately the same amount of recovery.

24 Q Okay.

25 A That's assuming we can deliver to our

1 pipeline.

2                   The immediate offset to the north, the  
3 Rosa Unit No. 45, it's currently delivering approximately  
4 10 to 12 MCF a day. It's produced 26 MMCF to date. We  
5 project an additional similar amount over the next 20  
6 years, assuming we can deliver 5 MCF or less to the  
7 pipeline, which may or may not be realistic.

8                   Our corporate -- well, another division  
9 within our corporation had determined that, although it's  
10 not a policy, current policy, they have determined just  
11 operating expenses, maintenance expenses, as far as a  
12 pipeline operation goes, somewhere in the neighborhood of  
13 19 to 20 MCF a day is an economic limit; therefore, these  
14 additional recoveries, probably, in the case of the Rosa  
15 No. 45, already meets that criteria.

16                   Like I said, currently they're not shut-  
17 ting the wells in, but that may be a possibility.

18                   Also, on the Rosa 84 we may curtail the  
19 recovery of some of those reserves, additional reserves  
20 that we project over the next 20 years.

21                   Q           Okay, geologically it's your opinion  
22 that you won't by injection into the Rosa 94, you won't  
23 water out any gas reserves or cause any reserves to be  
24 permanently lost.

25                   A           Yes, I believe that to be the case. As

1 I stated, we expect to push some of those noncommercial  
2 reserves towards the producing area.

3 MR. STOVALL: Mr. Cooter, I'm  
4 not -- I can't say for sure, but I think I remember pro-  
5 cedurally, and I'm not sure you offered this witness as an  
6 expert.

7 Just to clarify the record, if  
8 you don't mind. You -- you qualified him, I'm not sure  
9 that we have his record accepted, if you don't mind.

10 MR. COOTER: I would certain-  
11 ly tender him as an expert witness and ask that his qual-  
12 ifications be accepted.

13 MR. CATANACH: He is so  
14 qualified.

15 MR. STOVALL: That's it.

16 MR. COOTER: Thank you, Mr.  
17 Stovall.

18 MR. CATANACH: That's --  
19 that's all the questions I have of the witness. He may be  
20 excused.

21 Is there anything else in this  
22 case?

23 MR. COOTER: No, sir, that  
24 concludes our case. We do thank the Commission for its  
25 courtesy in permitting us to present our case at this time.

1 MR. CATANACH: Case 9401 will  
2 be taken under advisement.

## C E R T I F I C A T E

I, SALLY W. BOYD, C. S. R. DO HEREBY  
CERTIFY that the foregoing Transcript of Hearing before the  
Oil Conservation Division (Commission) was reported by me;  
that the said transcript is a full, true and correct record  
of the hearing, prepared by me to the best of my ability.

Sally W. Boyd CSR

I do hereby certify that the foregoing is  
a complete record of the proceedings in  
the Examiner hearing of Case No. PM,  
heard by me on June 8 1958.

Donald R. Catramba, Examiner  
Oil Conservation Division
