Re: Technical Infeasibility Proposal

Shell Pipeline Company LP
Jal Basin Station (GW-350)
Jal, Lea County, New Mexico

Section 5, Township 26 South, Range 37 East
Section 32, Township 25 South, Range 37 East

Dear Mr. Von Gonten:

H₂A Environmental, Ltd. (H₂A) is pleased to provide the enclosed Technical Infeasibility Proposal for the above reference site on behalf of Shell Pipeline Company LP, as discussed during our August 11, 2010 meeting at your offices in Santa Fe, New Mexico. The attached proposal presents a summary of historical remediation and monitoring activities, and a discussion outlining the technical infeasibility of reaching all applicable attainment standards at the subject site.

We trust that the enclosed information meets your needs at this time; however, should you have any questions or require any additional information, please do not hesitate to contact Kenneth Springer at 281.324.5921, or via electronic mail at kenneth.springer@shell.com.

Sincerely,

H₂A ENVIRONMENTAL, LTD.

A handwritten signature in blue ink that reads "Shannon S. Walker".

1.0 Purpose and Scope

This Technical Infeasibility (TI) Proposal summarizes the remediation of diesel fuel in soil and groundwater using high-vacuum, two-phase extraction (TPE) techniques at the Jal Basin Station, located in Jal, Lea County, New Mexico (the Site). Remediation involved the recovery of light non-aqueous phase liquid (LNAPL) and soil vapor from the subsurface, in addition to the extraction, treatment, and discharge of hydrocarbon-impacted groundwater. Recovery data are summarized to demonstrate that closure of the Site under the existing standards is technically infeasible. Therefore, an alternative abatement plan is proposed per 19.15.30.9E of the New Mexico Administrative Code (NMAC) to achieve closure of the Site.

2.0 Site Description

2.1 Site History

The Site is a transportation and storage facility for crude oil received from area crude oil producing wells. Approximately 1.8 million barrels of crude oil are stored at the Site and pumped via pipeline to various refining facilities. Plains All American Pipeline Company, LP currently operates the Jal Basin Station facility.

The Site is located approximately 2 miles south of Jal, in the northeast quarter of the northeast quarter of Section 5, Township 26 South, Range 37 East, in Lea County, New Mexico. Jal Station is not located in an incorporated city or town. A Site Location Map is included as Figure 1.

Site improvements are situated in the central portion of the property and encompass approximately 55 acres of the 80-acre property. The northern and southern portions of the property are undeveloped. A Site Plan, showing the location of the onsite remediation system and groundwater monitoring wells, is presented as Figure 2. A perimeter fence, approximately 6 feet high with three strands of barbed wire, surrounds the developed portion of the Site.

2.1.1 Nature of Release

A subsurface investigation identified the presence of diesel fuel in soil and groundwater at the Site. Historically, diesel fuel was used to power pipeline pump engines. The apparent source of the diesel fuel was the transfer piping and day tank supplying diesel fuel to the engines. The former diesel-fueled pumps have since been replaced with electric pumps.

2.1.2 Description of Previous Investigations

The release at the Site was confirmed during a Phase II Limited Environmental Subsurface Investigation performed by StanTech Environmental Services in January of 1998. During the investigation, two monitoring wells (MW-01 and MW-02) were installed and three soil borings (B-1 through B-3) were advanced. LNAPL was observed in monitoring well MW-02 at an approximate thickness of 3 feet. A water sample was collected from the onsite water well utilized as a non-potable water source for the facilities located at this site. Results for total petroleum hydrocarbons - diesel range organics (TPH-DRO), TPH – oil range organics, and benzene, toluene, ethylbenzene, and xylenes (BTEX) were below the laboratory detection limits; however, a TPH – gasoline range organics (GRO) concentration of 0.088 mg/L was observed.

Following confirmation of the release, an additional 13 monitoring wells (MW-03 through MW-15) were installed to delineate the horizontal and vertical extent of hydrocarbon impact from the suspected source area, and the results were summarized in the Stage I Abatement Plan, dated April 1999, and Additional Stage I Abatement Activities, dated January 2000, both completed by KEI Consultants, Ltd. (KEI).

Soil samples collected during monitoring well installation were analyzed for the presence of various chemicals of concern (COCs), including benzene, BTEX, TPH, and polycyclic aromatic hydrocarbons (PAHs). The ranges of results are summarized in the chart below.

SOIL CONCENTRATIONS (mg/kg)		
ANALYTE	MINIMUM	MAXIMUM
Benzene	ND	0.46
BTEX	ND	47.1
TPH	ND	11,500
PAHs	ND	1.13

Notes:

mg/kg - milligrams per kilogram

ND - not detected

Groundwater samples collected from the onsite monitoring wells were also analyzed for benzene, BTEX, and PAHs, and also for total dissolved solids (TDS). The ranges of results are summarized in the chart below.

GROUNDWATER CONCENTRATIONS (mg/L)		
ANALYTE	MINIMUM	MAXIMUM
Benzene	ND	0.007
BTEX	ND	0.017
PAHs	ND	0.038
TDS	454	2,670

Notes:

mg/L - milligrams per liter

ND - not detected

It should be noted that groundwater samples were not collected from the onsite monitoring wells in which LNAPL was observed, including wells MW-02, MW-03, MW-04, MW-06, MW-08, and MW-09 at thicknesses ranging from 0.02 to 8.28 feet. Based on the noted LNAPL thicknesses, fluid recovery pumps were installed in wells MW-02, MW-03, MW-06, and MW-09 to facilitate rapid removal of LNAPL and to control the extent of the LNAPL plume.

Following the installation of wells MW-03 through MW-15, the facility required the installation of a replacement electric pump for pipeline operations. Location of the new

pump required plugging and abandoning of MW-07. Well MW-15 was installed to replace MW-07.

A pilot test was conducted in December 1999 and January 2000 using a high-vacuum remediation (HVR) system. Results of the test indicated that application of high-vacuum, TPE would effectively pull groundwater from the depths at which groundwater and LNAPL occur at the Site (approximately 90 feet below ground surface [bgs]). Based on the results of the pilot test, the Stage 2 Abatement Plan, dated February 2000, also completed by KEI, summarized the installation and initial operation of the high-vacuum soil and groundwater remediation system at the Site.

Based on the success of the mobile HVR system, a permanent system was installed onsite in January 2001. Following installation of the permanent system, a discharge plan was submitted and approved and two injection wells were installed, allowing treated groundwater to be discharged onsite. In 2002, the system was upgraded to extract from additional onsite wells, which resulted in an increase in the amount of LNAPL recovered. The system continued to operate through June 2008, at which time it was shut down due to a lack of LNAPL recovery.

2.2 Site Geology, Hydrogeology, and Hydrology

2.2.1 Geology

Two types of soil were encountered during subsurface investigations at the Site, a red to brown colored sand and a tan to brown colored sand. The red to brown colored sand is fine to coarse grained, well graded, loose, contains sparse gravel, and varies from saturated to dry. The tan to brown colored sand is fine to medium grained, partially lithified, very calcareous with caliche nodules, medium to very dense, and varies from dry to moist. Four cross-sections were constructed for the Site, the locations of which are shown in Figure 3, Cross-Section Locations. Generalized Cross-Sections A-A' (east to west), B-B' (north to south), C-C' (southwest to northeast), and D-D' (northeast to southwest) are shown in Figures 4 through 7, respectively.

2.2.2 Hydrogeology

Depth to groundwater measured in the onsite monitoring wells has ranged from a minimum of 84.03 feet bgs to a maximum of 100.45 feet bgs. The TDS concentrations in onsite monitoring wells have ranged from 454 to 2,670 mg/L. Chloride concentrations in these wells have ranged from 4.9 to 767 mg/L. While hydraulic conductivity at the Site has not been directly measured, lithology and historical production data indicate a range of 1×10^{-2} to 1×10^{-3} centimeters per second. The groundwater gradient appears to be approximately 0.0036 feet per foot and has been consistently toward the west – southwest. Figures 8 and 9 show the groundwater elevation in March and June 2011, respectively. Historic groundwater gauging data are summarized in Table 1.

2.2.3 Surface Water Hydrology

Surface water bodies in the vicinity of the Site include a pond, creek, and an aqueduct. A pond is located approximately 0.4 mile upgradient to the east-southeast, an unnamed intermittent stream/creek is located approximately 1.7 miles side-gradient to the northwest, and an aqueduct is located approximately 1.8 miles side-gradient to the northwest of the subject property.

2.3 Water Well Inventory

A search for water wells located within a 1-mile radius of the Site boundary was performed by Banks Environmental Data in August 2011. The Banks Environmental Data Water Well Report was prepared from existing water well databases and/or additional file data/records research conducted at the State Engineers Office located in Santa Fe, New Mexico. A cluster of wells were noted within the 1-mile radius to the west of Jal Station; however, these were determined to be monitoring wells associated with the Site, but located offsite. No additional wells were identified via the search. A copy of the Water Well Report is included in Appendix A for reference. It should be noted that an existing water well (used for non-potable purposes only) is known to be located onsite at Jal Station. This well is discussed further in Section 2.4.

While not located within a 1-mile radius of the Site, several current and former City of Jal water wells are located within the vicinity. Two former wells bottomed out in the Santa Rosa sandstone (Tr) at depths of 500 feet bgs (Well 25.37.19.221) and 450 feet bgs (Well 25.37.19.240). Groundwater levels in these wells were noted to be 284 and 65 feet bgs, respectively. The wells were later abandoned as public supply wells and the City of Jal purchased an irrigation well located approximately 5 miles east of Jal, and converted it into a public supply well. The well bottomed in the Ogallala formation (To) at a depth of 152 feet bgs (Well 25.37.13.312a). Depth to water in the well was noted to be 73 feet bgs. The city also drilled three other wells in Township 26 South, Range 36 East (Wells 26.36.18.311, 26.36.21.233, and 26.36.21.443). The wells were drilled in the Quaternary Alluvium (Qal) to depths of 559, 700, and 159 feet bgs, respectively. Well 26.36.21.443 was dry when drilled. Groundwater in Wells 26.36.18.311 and 26.36.21.233 was noted at depths of 220.8 and 198.0 feet bgs, respectively. The following is a summary of information regarding the City of Jal water wells.

WELL NUMBER	AQUIFER	TOTAL DEPTH OF WELL	DEPTH TO GROUNDWATER	YEAR DRILLED	TOTAL DISSOLVED SOLIDS
26.37.7.331	Tr	467		1937	
25.37.19.221	Tr	500	284.0	1954	825
25.37.19.240	Tr	450	65	1942	759
25.37.15.310	Qal	70	65	1942	
25.37.13.312a	To	152	73	1954	250/295
26.36.18.311	Qal	559	220.8	1960	
26.36.21.233	Qal	700	198.0	1960	
26.36.21.443	Qal	159	Dry	1958	

2.4 General Sensitive Receptor Survey

The groundwater aquifer at the Site is considered a potential drinking water aquifer by the State of New Mexico. While there are no known shallow water wells located offsite within a 1-mile radius of the Site boundary, water from the shallow groundwater bearing unit could be utilized for human or agricultural use. Deep groundwater use near the facility consists of both potable and agricultural use. As mentioned in Section 2.3, one water well exists at the Site. This well has historically been used for non-potable water supply for the onsite facility. This well has been periodically sampled for metals, general water quality parameters, and volatile organics. Laboratory analytical results from a 2002 sampling event are included in

Appendix B. Results indicate that no volatile organics were present in the groundwater above the laboratory detection levels. However, fluoride and TDS were present at levels in excess of the State of New Mexico Human Health Standards for groundwater (20.6.2.3103 NMAC).

3.0 Onsite Remediation Activities

3.1 Operations

Initially, a mobile, HVR, multi-phase extraction (MPE) system was installed onsite to recover LNAPL (diesel), impacted groundwater, and soil vapor from the Site subsurface. The MPE system, configured as TPE, involved the simultaneous recovery of hydrocarbons from the subsurface as free liquid, dissolved-phase, and vapor-phase. The system consisted of a liquid ring pump (LRP), extensive liquid/solid/vapor separation equipment, and a filtration water treatment system. Based on results of a pilot test, vapor abatement equipment was not required to maintain compliance with emissions requirements. The system was started in January 2001 and initially extracted from two wells. An additional well was added in January of 2002.

The system recovered a significant volume of LNAPL during the first year of operation; however, to further address off-site plume migration, system capacity was doubled to gain further hydraulic control of the plume. The additional capacity increased the minimum site extraction capability to six wells. Ultimately, four more extraction wells were installed, bringing the final total to ten wells.

3.2 Results of Onsite Remediation

The onsite remediation system effectively achieved and maintained hydraulic control of the LNAPL plume. Figure 10 shows groundwater elevation contours as measured in October 2005 during system operation. A notable depression in the vicinity of LNAPL/groundwater extraction wells is evident. Effectiveness of the system is further documented in Figure 11, which shows the large extent of the vacuum radius of influence as measured in June 2005.

Figures 12 through 20 depict the substantial reduction in the size of the LNAPL plume as a direct result of active remediation efforts at the Site. Figure 12 shows the extent of the plume prior to the initiation of active remediation, which began in November 2000. Figures 13 through 19 track plume reduction throughout the remediation process. Figure 20 shows the limited extent of the plume as noted in July 2008, immediately following shut down of the system at the end of June 2008. As shown in the figure, the maximum LNAPL thickness noted at that time was 0.06 feet at MW-14.

Figures 21 through 25 show that while LNAPL thicknesses have increased since system shut down in mid-2008, they have recharged to less than 25 percent of maximum historical thicknesses noted (8.37 feet at well MW-02). While remaining LNAPL at the Site appears to demonstrate some local mobility, it has not migrated outside the historic footprint of the LNAPL plume. Figure 26 shows mean corrected groundwater elevation versus the maximum, mean, and minimum LNAPL thickness through time. There is a direct correlation between increased LNAPL thicknesses and periods of decreased regional groundwater elevation, as expected of LNAPL under unconfined conditions. This is further evident in Figure 27, which plots mean LNAPL thickness as a function of corrected groundwater elevation. The regional groundwater elevation has declined steadily since the system was

shut down in June 2008; therefore, the noted increase in LNAPL thickness at the Site is not unexpected.

In January 2011, the LNAPL present in well MW-24 was evacuated and the well was monitored to evaluate LNAPL recharge. The LNAPL thickness prior to bailing was 1.26 feet. Approximately 1 gallon of LNAPL and 2 gallons of groundwater were removed from the well, after which, gauging commenced immediately. After nearly 3.5 hours of monitoring, LNAPL thickness in the well had only recharged to a thickness of 0.40 feet. The recharge data from the baildown test are provided in Figure 28.

Through several years of active remediation of the onsite diesel plume, over 60,000 gallons of free-phase product and soil vapor were recovered from the subsurface and over 4 million gallons of groundwater were treated and discharged. Recovery data are summarized in Table 2, and Figures 29 and 30 show monthly and cumulative product recovery, respectively, during operation of the onsite remediation system. The majority of LNAPL recovery occurred from 2001 through mid-2003. During that time, approximately 48,000 gallons (~80%) of LNAPL were removed from the subsurface. From mid-2003 through 2005, a more moderate amount of recovery occurred, approximately 12,000 gallons (~12%) of free product. In general, it appears that the LNAPL thickness decreased in 2004 and 2005 as a result of active LNAPL removal. Low to no recovery (~2%) by the system was observed from 2005 through June 2008. Based on the nominal amount of product recovered during system operations from October 2007 through June 2008 (approximately 42 gallons), it was determined that meaningful hydraulic recovery of free product was no longer practicable, and active remediation was discontinued.

Based on the overall decreased LNAPL thicknesses, a lack of LNAPL recharge following removal, and decreased LNAPL recovery over time, the system was shut down in June 2008. Based on the results of subsequent gauging events, LNAPL persists in some wells at the Site; however, even during periods of decreased regional groundwater elevation, LNAPL thicknesses remain less than 25 percent of historic maximum thicknesses measured at the Site.

By plotting the volume of annual product and vapor recovery as a function of cumulative recovery, a decline curve analysis that estimates the expected ultimate recovery (EUR) from the extraction wells can be performed. This analysis is provided in Figure 31, which shows that based on several years of operating data, the EUR is approximately 60,000 gallons of combined free product and soil vapor. Similar data are depicted in Figure 32, which provides the rate transient analysis (RTA) by again plotting annual product and vapor recovery, but this time as a function of elapsed years of active remediation. Based on the data, we can expect to have reached diminishing returns (i.e., little to no product recovery) within seven to eight years of system operation. Therefore, based on the amount of free-phase product and vapor recovered to date (approximately 60,000 gallons), and the length of time for which the remediation system operated (approximately 7.5 years), the EUR has been achieved.

4.0 LNAPL Fingerprinting and Analysis of Physical Properties

In September 2009, a sample of LNAPL from well MW-14 was collected and sent to Torkelson Geochemistry, Inc. (Torkelson) to be fingerprinted and to have several physical properties evaluated. Torkelson indicated that the sample was a moderately weathered middle distillate, either diesel fuel or fuel oil. There appeared to be about a 25 percent loss of the more volatile

components of the sample due to evaporation, or more likely, due to active remediation that occurred at the Site. A simulated distillation curve for the sample is provided in Appendix C along with a summary of physical properties. The sample distillation curve is shown along with several other standard curves from various other hydrocarbon containing materials. Comparison of the distillation curve to the diesel standard further confirms the nature of the LNAPL present at the Site.

Two additional samples were collected in April 2011, one each from wells MW-14 and MW-24. The samples were submitted directly to Shell Projects & Technology – HSE Services for fingerprinting and density analysis. Results were similar to those of 2009, confirming the samples were a somewhat weathered diesel fuel. Neither benzene nor toluene were detected in either LNAPL sample. Ethylbenzene was present in only one sample at a concentration below the New Mexico Human Health Standards for groundwater (20.6.2.3103 NMAC). Xylenes were present in both samples, but also at concentrations below the New Mexico Human Health Standards for groundwater (20.6.2.3103 NMAC). See Appendix C for LNAPL sample details.

5.0 Soil Sampling and Analytical Results

A summary of historic soil sampling results is provided in Table 3. The abatement standards, 19.15.30.9 NMAC, require abatement of “the vadose zone so that water contaminants in the vadose zone will not with reasonable probability contaminate ground water or surface water, in excess of [the New Mexico Human Health Standards for groundwater] through leaching, percolation, or other transport mechanisms, or as the water table elevation fluctuates.” Therefore, two additional soil borings were advanced, SB-4 was installed along the northern side of the onsite office building, north of MW-24 (the well with the maximum LNAPL rebound), and SB-5 was installed in the former source area, just west of MW-18. The locations of SB-4 and SB-5 are noted on Figure 2, the Site Plan. Boring logs for the two soil borings are provided as Figures 33 and 34. Three soil samples were collected at each location, one between five and ten feet bgs, one at the bottom of the boring, and since all photoionization detector readings were zero prior to reaching the bottom of the boring, one within the approximate middle of the bottom half of the soil column. BTEX concentrations were below laboratory detection limits in all samples analyzed. Slightly elevated TPH concentrations were noted at the bottom of each boring; however, this was likely the result of the proximity to residual LNAPL at the capillary fringe.

6.0 Groundwater Sampling and Analytical Results

6.1 Previous Groundwater Monitoring Schedule

Following shutdown of the onsite remediation system, groundwater monitoring was completed on a quarterly basis in 2008. Onsite groundwater was evaluated for BTEX quarterly, dissolved metals during the second, third, and fourth quarters, and PAHs during the fourth quarter. During 2009 and 2010 groundwater monitoring was completed on a semi-annual basis with all wells gauged quarterly. The first 2009 monitoring event involved sampling all delineation and monitoring wells not containing LNAPL to ensure that no plume migration had occurred. The second groundwater monitoring event of 2009 focused on historically impacted wells only to monitor attenuation progress. During subsequent monitoring events, any observed product was bailed from the onsite monitoring wells and all wells (including those where measurable thicknesses of LNAPL were noted) were sampled

for volatile organic compounds, PAHs, oxygenates, and metals. Results of historic groundwater monitoring are summarized in the attached Table 4.

6.2 Discussion of Onsite COC Concentrations

Based on the groundwater sampling results obtained to date, the primary onsite COC is benzene. While over time, laboratory results have indicated detected concentrations of other COCs, some of which historically exceeded (or exceed) the New Mexico Human Health Standards for groundwater (20.6.2.3103 NMAC); it appears that these concentrations have since declined to below their applicable limits or are present at background concentrations (metals) that exceed the applicable limits. While detected benzene concentrations are clearly declining, benzene currently persists above the applicable limit of 0.01 milligrams per liter in wells MW-06, MW-18, MW-20, and MW-24. Figures 35 through 38 demonstrate the declining concentrations noted at each location.

Based on recent groundwater sampling events, the dissolved-phase concentrations of BTEX and PAHs generally appear to be stable or declining. As noted in Section 4.0, BTEX concentrations in LNAPL samples were either absent or very low, likely as a result of the compositional change of the LNAPL accomplished through remediation via MPE. A noted exception is MW-14, which continues to demonstrate a measurable thickness of free product and recently (in 2010) demonstrated PAH concentrations in excess of the New Mexico Human Health Standard for PAHs in groundwater (20.6.2.3103 NMAC). A subsequent sampling event (in 2011) showed that the concentration of PAHs at MW-14 is currently below the applicable standard. Until the 2010 sampling event, PAH concentrations at MW-14 had remained below the applicable standard since December 2005. Therefore, the elevated PAH concentrations noted at MW-14 in 2010 appear anomalous, and may represent inadvertent inclusion of LNAPL from the well in the groundwater sample.

6.3 Discussion of Onsite Toxic Pollutants

Contaminants defined as toxic pollutants, which have also been assigned a standard per 20.6.2.3103 NMAC, include BTEX compounds and PAHs (sum of total naphthalene and 1-methylnaphthalene) and were discussed in Section 6.2. Additional toxic pollutants that have historically been detected in multiple wells during monitoring of onsite groundwater include: fluorene, methyl tert-butyl ether (MTBE), phenanthrene, pyrene, 2-methylnaphthalene, benzo(a)pyrene, anthracene, and fluoranthene. The following chart summarizes the current (2011) occurrence of toxic pollutants at the Site.

2011 OCCURRENCE OF TOXIC POLLUTANTS (mg/L)		
ANALYTE	WELLS	DETECTED CONCENTRATION
Fluorene	MW-06	0.0123
MTBE	MW-17	0.00059
Phenanthrene	MW-06	0.008
Pyrene	MW-06	0.0092
2-Methylnaphthalene	MW-09, MW-19, MW-24	0.0082, 0.0076, 0.0081
Benzo(a)pyrene	NONE	NA
Anthracene	NONE	NA
Fluoranthene	NONE	NA

Notes:

mg/L - milligrams per liter

NA - not applicable, none detected

7.0 Technical Infeasibility of Site Closure Under Current Standards

7.1 Conclusion Established by Onsite Investigation/Remediation

LNAPL persists in several wells at the Site; however, it has recharged to less than 25 percent of originally noted thicknesses. Based on the nominal amount of product recovered during the last two years of system operation (approximately 660 gallons, or one percent of the total amount of LNAPL recovered during operation of the system), meaningful hydraulic recovery of free product is no longer possible. Based on recent groundwater sampling events, the dissolved-phase concentrations of BTEX/PAHs generally appear to be stable or declining and BTEX compounds are absent or at very low concentrations in LNAPL samples. Based on the results of the operation of the onsite MPE system, compliance with the abatement standard requiring zero measurable LNAPL thickness in wells, via hydraulic recovery, is technically infeasible.

7.2 Alternative Remediation Technologies

Alternative remediation technologies have also been considered. Initially, continued operation of the onsite MPE system was evaluated. However, based on the nominal amount of product recovered during the final two years of system operation, meaningful hydraulic recovery of free product was not expected. However, in the spring of 2011, the system was temporarily restarted to evaluate the recovery potential. During approximately one month (April 2011) of continued MPE at wells MW-02, MW-12, MW-14, and MW-24 (which exhibited up to 1.42 feet [MW-24] of LNAPL prior to extraction), only 15 gallons of LNAPL were recovered. This equates to a flow rate of approximately only 0.125 gallons of LNAPL per day from each well. Almost 2,000 gallons of groundwater were also extracted, treated, and discharged. Based on the limited amount of LNAPL recovered, it was determined that the LNAPL remaining in the subsurface at the Site is not readily hydraulically recoverable.

In addition to an evaluation of the technical impracticability of attaining the abatement standards, 19.15.30.9F(1)(a) NMAC also proposes an evaluation of the “relationship between the economic and social costs and benefits,” for which consideration of the environmental sustainability of continued active remediation can be a good indicator. As demonstrated during April 2011, via MPE at four wells exhibiting a measurable LNAPL thickness, the potential for hydraulic recovery of LNAPL at the Site is very low due to historic LNAPL removal and apparent achievement of low to near residual LNAPL saturations. Given the substantial electrical power consumption required to operate two 25-horsepower LRP s, multiple liquid transfer pumps, and associated control systems, as well as the resource consumption represented by periodic replacement and disposal of large volumes of zeolite filter clay and carbon for liquid absorption treatment, and the hydrocarbon and associated pollutants generated during twice monthly operation and maintenance visits (travelling via pickup truck to and from the Site), the low hydraulic recovery potential is not sustainable from a resource consumption evaluation. Therefore, this qualitative sustainability evaluation supports the conclusion that hydraulic recovery of the LNAPL at the Site is technically impracticable.

Enhancement of ongoing natural attenuation through in-situ chemical oxidation via subsurface injection was also considered. Local geology consists of fine to coarse grained sand with some gravel, making the Site suitable with respect to hydraulic conductivity/permeability for adequate dispersion of injected oxidants. However, while the Site geology may be conducive to chemical delivery, injection is not typically a good option for the remediation of free-phase LNAPL because the oxidant demand is too high. So, while

chemical oxidation is known to be very effective at many sites impacted with petroleum hydrocarbons, the residual LNAPL present in the subsurface would greatly reduce the efficacy of chemical oxidation at the subject site.

When evaluating various alternative remedial technologies, natural attenuation of remaining site impacts was considered. Based on analytical data obtained during recent onsite groundwater monitoring events, the dissolved-phase concentrations of onsite COCs are stable or declining. However, several wells still exhibit measurable thicknesses of free product. It is not clear based on existing data that compliance with the zero measurable LNAPL thickness in wells abatement standard could be met via natural attenuation.

7.3 Alternative Remedial/Abatement Standards

Benzene concentrations at wells MW-06, MW-18, MW-20, and MW-24 remain above the corresponding New Mexico Human Health Standard for groundwater (20.6.2.3103 NMAC). Per 19.15.30.9E(b) NMAC, "The responsible person may demonstrate technical infeasibility by a statistically valid extrapolation of the decrease in concentration of a water contaminant over the remainder of a 20 year period, such that projected future reductions during that time would be less than 20 percent of the concentration at the time the responsible person proposes technical infeasibility." While Figures 35 through 38 show that benzene concentrations at these four locations will continue to decrease such that they will be below the corresponding Human Health Standard within the 20-year period, they also show that the concentrations will degrade by more than 20 percent of their current value. Therefore, we propose that benzene concentrations at the Site be allowed to naturally attenuate rather than propose an alternative remedial/abatement standard. Benzene was not detected in LNAPL samples and is expected to continue to degrade in groundwater.

While measurable thicknesses of LNAPL persist at the Site, it is evident that the residual LNAPL is not readily recoverable hydraulically. Figure 27 demonstrates, using only data collected since the limit of hydraulic recovery was achieved (June 2008), that measured LNAPL thicknesses in the wells are directly related to changes in regional groundwater elevation. Therefore, rather than propose an alternative abatement standard (i.e., LNAPL thickness) we request a waiver to the abatement standard requiring zero measurable LNAPL thickness in wells at the Site.

8.0 Proposed Site Closure Activities

8.1 Public Notice

Following submittal of this TI Proposal and a Site Closure Plan, and pending guidance from the NMOCD, public notice of the proposed onsite activities will be provided to the following:

- surface owners of record within 1 mile of the Site perimeter;
- county commission of geographic area;
- appropriate city officials within city limits or within 1 mile of city limits;
- person(s) identified by director as requiring notice;
- New Mexico trustee for natural resources and any other applicable local, state, and federal regulatory agencies governing the Site; and
- governor or president of a tribe, pueblo, or nation if located within 1 mile of the geographic site boundary.

Following approval of the TI Proposal and Site Closure Plan, the applicant will issue public notice in an approved form in a newspaper of general circulation in the county in which the release occurred and in a newspaper of general circulation in the state. The published notice shall include the following:

- responsible party's name and address;
- location of proposed abatement;
- brief description of the source, extent of estimated volume of release; whether the release occurred in the vadose zone, groundwater, or surface water; and description of the proposed abatement plan;
- brief description of the procedures the director followed in making a final determination;
- statement discussing where the public can view a copy of the abatement plan;
- statement relaying that written comments and requests for public hearings (including reasons why the hearing should be held) will be reviewed if received within 30 days of the date of publication of public notice; and
- an address and phone number at which interested persons may obtain further information.

8.2 Site Closure Report

Following completion of any NMOCD-required site closure activities, a report documenting completion of such activities and requesting "No Further Action" will be submitted to the NMOCD.

8.3 Offsite Property Owners

It should be noted that the historic plume footprint extended offsite onto neighboring U.S. Government Bureau of Land Management (BLM) and State of New Mexico lands. Measurable LNAPL thicknesses continue to be noted in these offsite wells. Therefore, both the BLM and the State of New Mexico should be contacted regarding the subject TI proposal to gauge their potential acceptance and to identify any additional requirements.

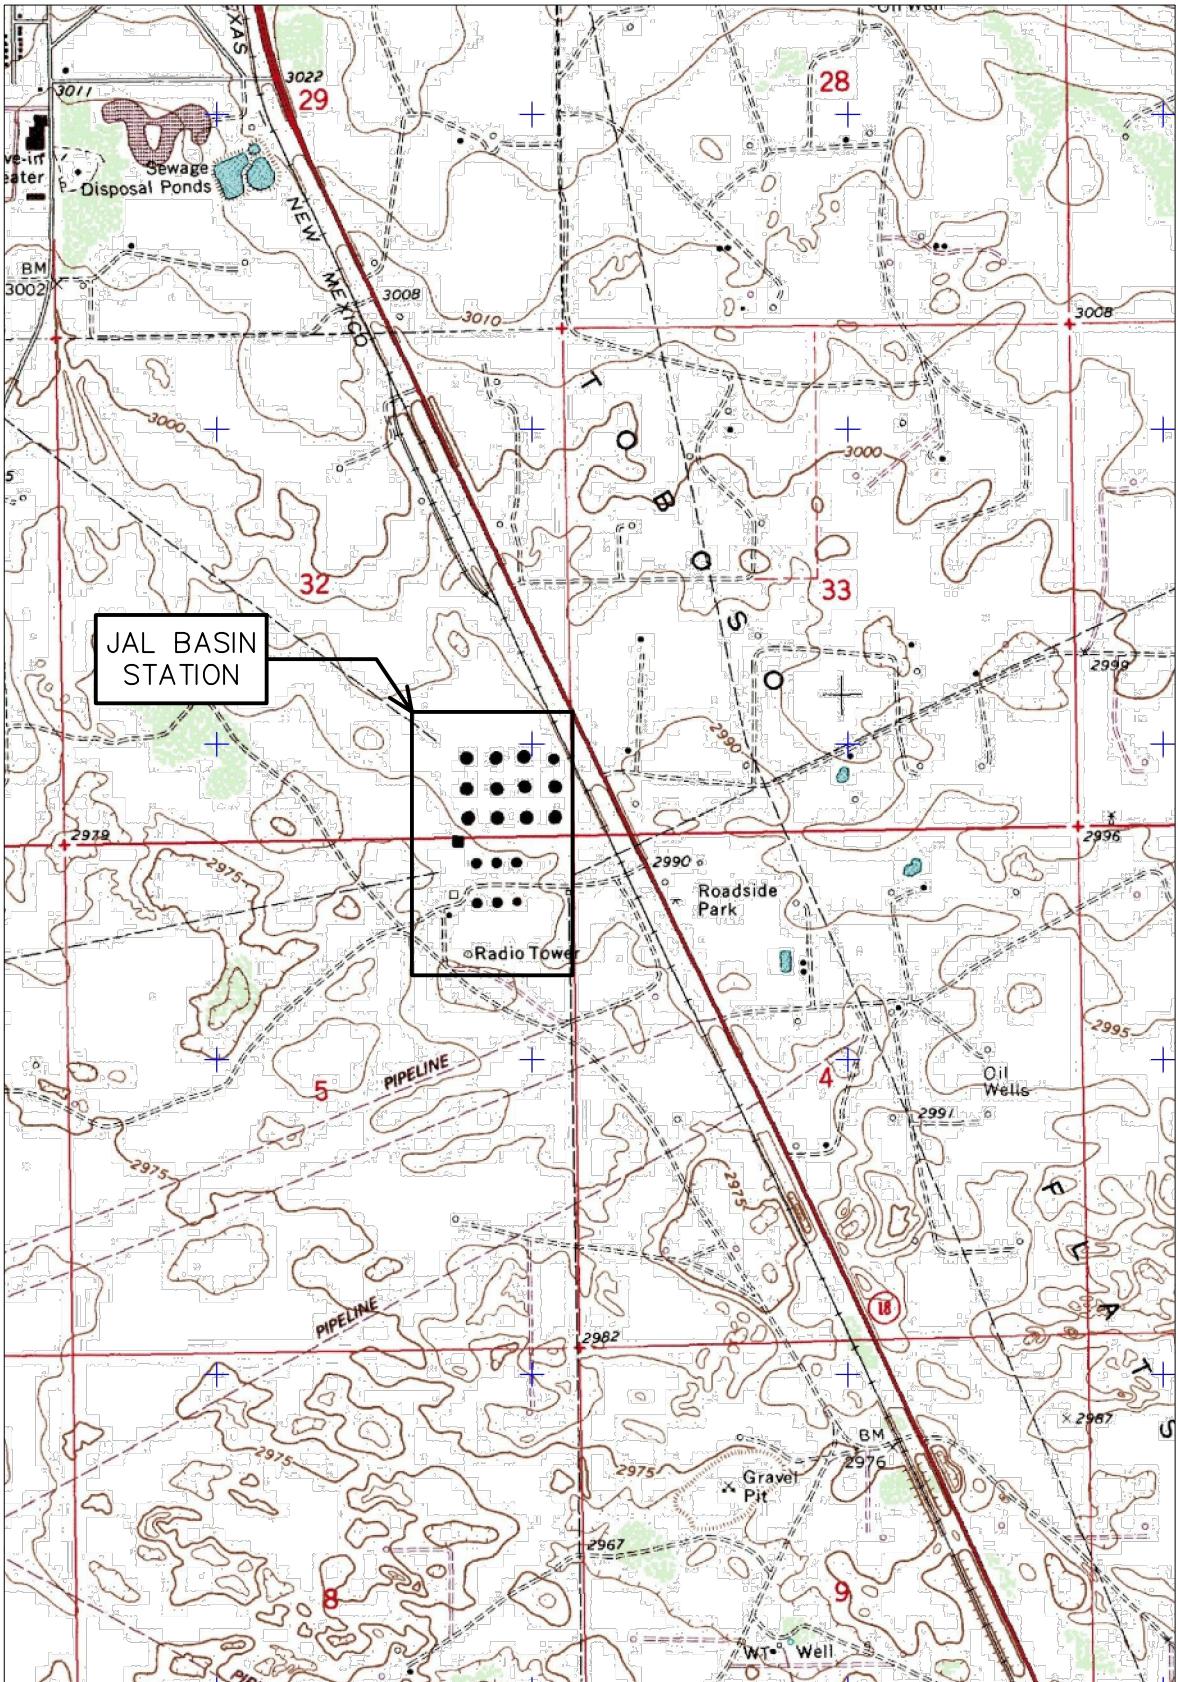

9.0 Conclusions

Extensive active remediation efforts using high-vacuum, MPE techniques have resulted in the recovery of both LNAPL and soil vapor from the subsurface, and the extraction, treatment, and discharge of hydrocarbon-impacted groundwater. Based on the data presented and summarized herein, closure of the Site under the existing standards is technically infeasible. While remaining LNAPL at the Site appears to demonstrate some local mobility, it has not migrated outside the historic maximum LNAPL plume footprint. Also, based on the strong correlation between LNAPL thickness, regional groundwater elevation, and the steady decline in regional groundwater since the system was shut down in June 2008; current LNAPL thicknesses at the Site are not unexpected. Further, there are no current or likely future receptors located in the Site vicinity and therefore, the presence of LNAPL presents no risk to human health or the environment.

- Active remediation occurred at the Site from November 2000 through June 2008, during which time over 60,000 gallons of free-phase diesel fuel and vapor were recovered from the subsurface via two-phase (MPE) extraction.

- Approximately 48,000 gallons (~80%) of LNAPL were recovered from 2001 through mid-2003, and approximately 12,000 gallons (~12%) were recovered from mid-2003 through 2005. LNAPL recovery continued to decrease asymptotically. Based on the nominal amount of product recovered from October 2007 through June 2008 (approximately 42 gallons, or about 0.1 percent), it was determined that meaningful hydraulic recovery of free product was no longer practicable, and active remediation was discontinued in June 2008 as a result of these diminishing returns.
- Remediation efforts effectively achieved and maintained hydraulic control of the LNAPL plume, resulting in a substantial reduction of the plume footprint.
- Measurable LNAPL persists in several wells as a result of decreased groundwater elevations across the Site since shutdown of the active remediation system. While this is an indication of some local mobility, LNAPL has not migrated outside of the historic LNAPL plume footprint even in the absence of hydraulic control.
- Based on the results of the decline curve analyses (both the EUR and the RTA), the limits of hydraulically recoverable LNAPL have been reached (i.e., approximately 60,000 gallons of recovered product during 7.5 years of active recovery).
- A fingerprint analysis of remaining LNAPL at the Site indicated a weathered hydrocarbon (i.e., approximately a 25 percent loss of the more volatile components) likely due to active remediation efforts. Neither benzene nor toluene were detected in the samples analyzed.
- Recent soil sampling conducted in the former source area and adjacent to the well with the greatest LNAPL rebound indicated no hydrocarbon impacts until reaching the base of the vadose zone, likely the result of residual LNAPL and regional groundwater fluctuations.
- Based on recent groundwater sampling events, dissolved-phase concentrations of BTEX and PAHs appear to be stable or declining, indicating the remaining LNAPL is not acting as a continuing source for these constituents.
- While benzene persists in four wells at concentrations above the New Mexico Human Health Standard for groundwater, natural attenuation is occurring and extrapolation of future benzene concentrations demonstrates achievement of the standard in less than ten years.
- There are no current or likely future receptors located in the Site vicinity and therefore no risk to human health or the environment due to the presence of LNAPL at the groundwater table.

			Benzene - <0.0015 Toluene - <0.0015 Ethyl Benzene - <0.0015 Xylene (total) - <0.0039			Arsenic - <2.0 Barium - <20 Cadmium - <0.99 Chromium - 6.0 Lead - <2.0 Mercury - <0.042 Selenium - <2.0 Silver - <0.99	ND	6.23	11.3	NA	NA	NA	NA
		84-85	Benzene - <0.140 Toluene - <0.140 Ethyl Benzene - <0.140 Xylene (total) - <0.390	ND	ND	Arsenic - <1.9 Barium - 29.2 Cadmium - <0.97 Chromium - 2.3 Lead - <1.9 Mercury - <0.041 Selenium - <1.9 Silver - <0.97	7,420	2,200	ND	NA	NA	NA	NA
SB-5	05/18/11	9-10	Benzene - <0.0015 Toluene - <0.0015 Ethyl Benzene - <0.0015 Xylene (total) - <0.0040	ND	ND	Arsenic - <1.9 Barium - 21.9 Cadmium - <0.94 Chromium - 5.2 Lead - 2.7 Mercury - <0.038 Selenium - <1.9 Silver - <0.94	ND	23.9	44.7	NA	NA	NA	NA

Definitions:

BTEX - benzene, toluene, ethyl benzene, and xylene

DRO - diesel range organics

GRO - gasoline range organics

mg/kg - milligram per kilogram

MTBE - methyl tert-butyl ether

NA - not analyzed

ND - none detected

ORO - oil range organics

PAHs - polycyclic aromatic hydrocarbons

RCRA - Resource Conservation and Recovery Act

TPH - total petroleum hydrocarbon

Water Well Report™

DISCLAIMER/DETAILS

Banks Environmental Data Water Well Report™ is prepared from existing state water well databases and/or additional file data/records research conducted at the State Engineers Office located in Santa Fe, New Mexico.

Banks Environmental Data has performed a thorough and diligent search of all groundwater well information provided and recorded with the New Mexico State Engineers Office. All mapped locations are based on information obtained from the NMSEO. Although Banks performs quality assurance and quality control on all research projects, we recognize that any inaccuracies of the records and mapped well locations could possibly be traced to the appropriate regulatory authority or the actual driller. It may be possible that some water well schedules and logs have never been submitted to the regulatory authority by the water driller and, thus, may explain the possible unaccountability of privately drilled wells. It is uncertain if the above listing provides 100% of the existing wells within the area of review. Therefore, Banks Environmental Data cannot fully guarantee the accuracy of the data or well location(s) of those maps and records maintained by the New Mexico State Engineer regulatory authorities.

Subject: Jal Station, Comparison of 2009 and 2011 gas chromatography data
Attachments: QT diesel evaporation.doc

Hi Shannon.

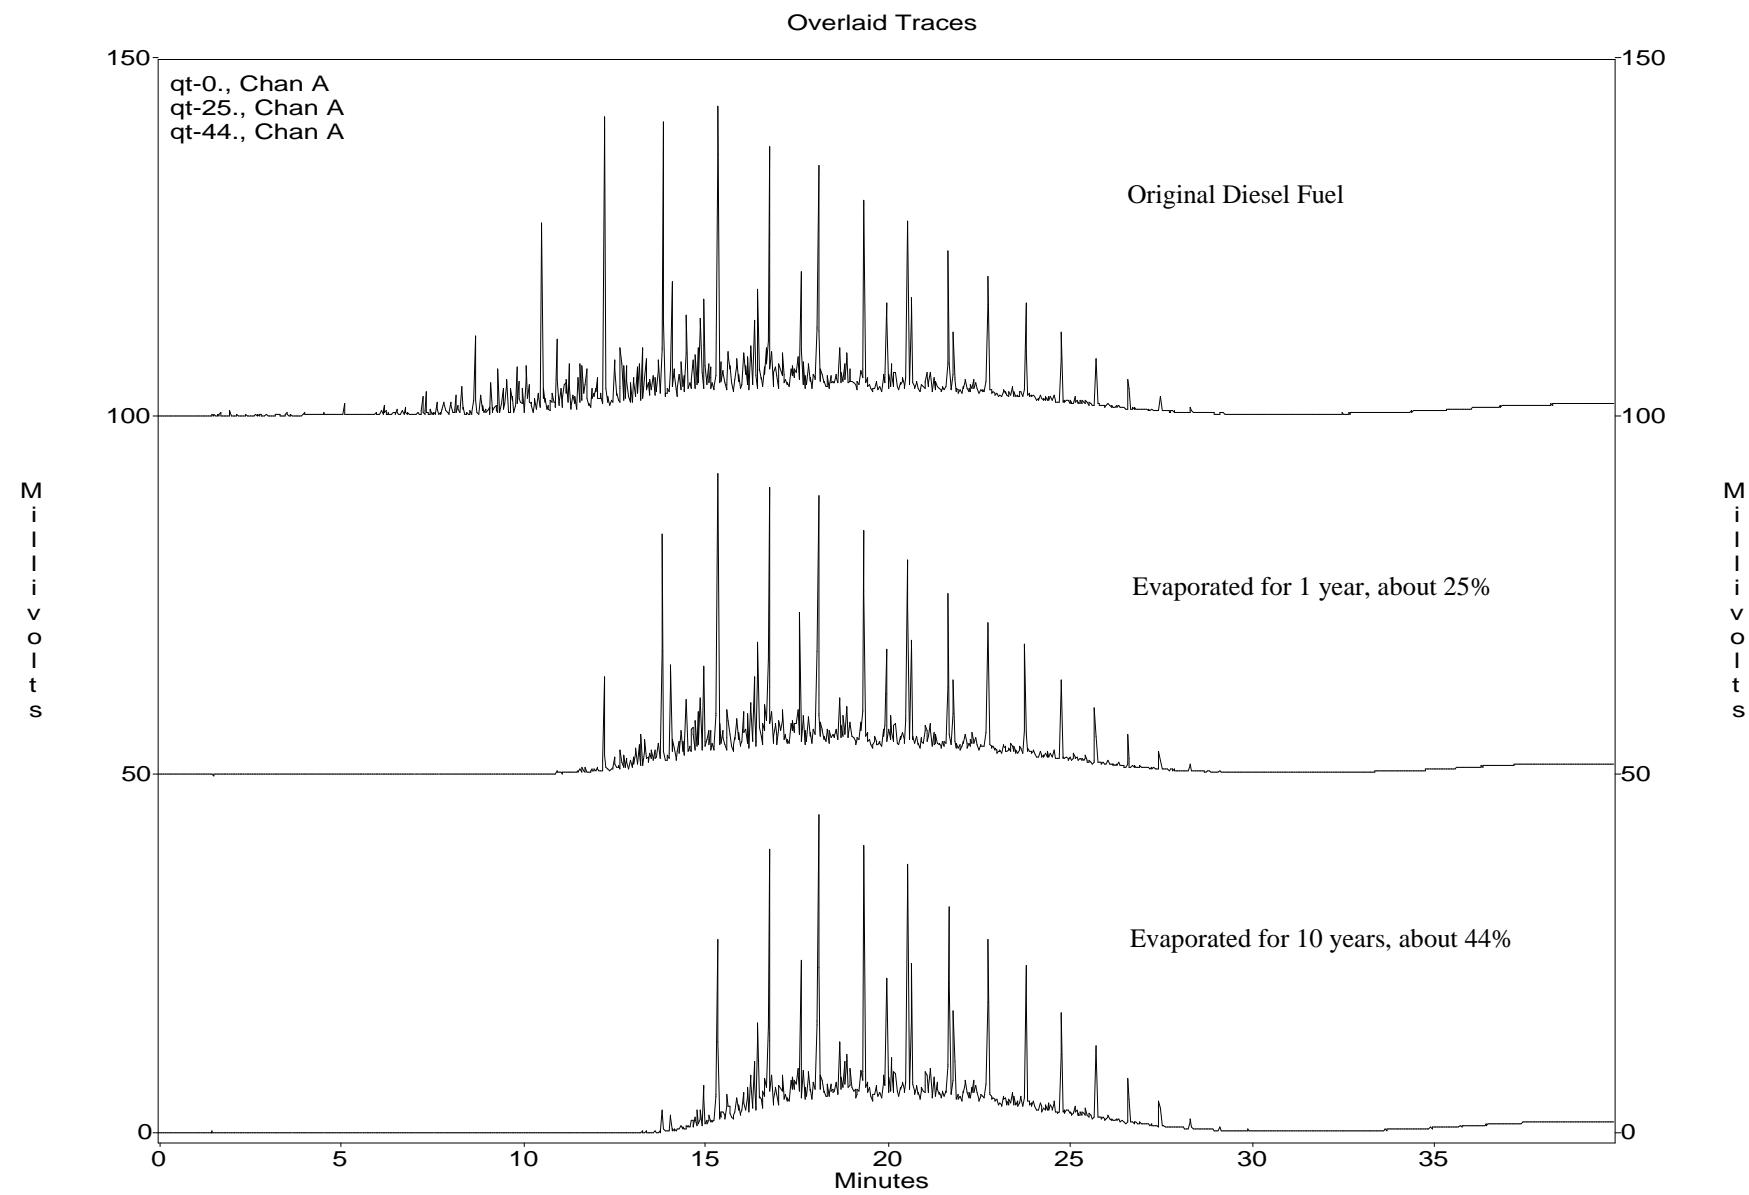

The following are my opinions and a comparison of the GC-FID analysis results of sample MW-14 analyzed by Torkelson Geochemistry, Inc. (TGI) 9-25-09 to the data you sent for samples MW-14 and MW-24 analyzed 4-19-11. The gas chromatograms for the two samples analyzed in 2011 also appear to be the results of GC-FID but may be GC-MS.

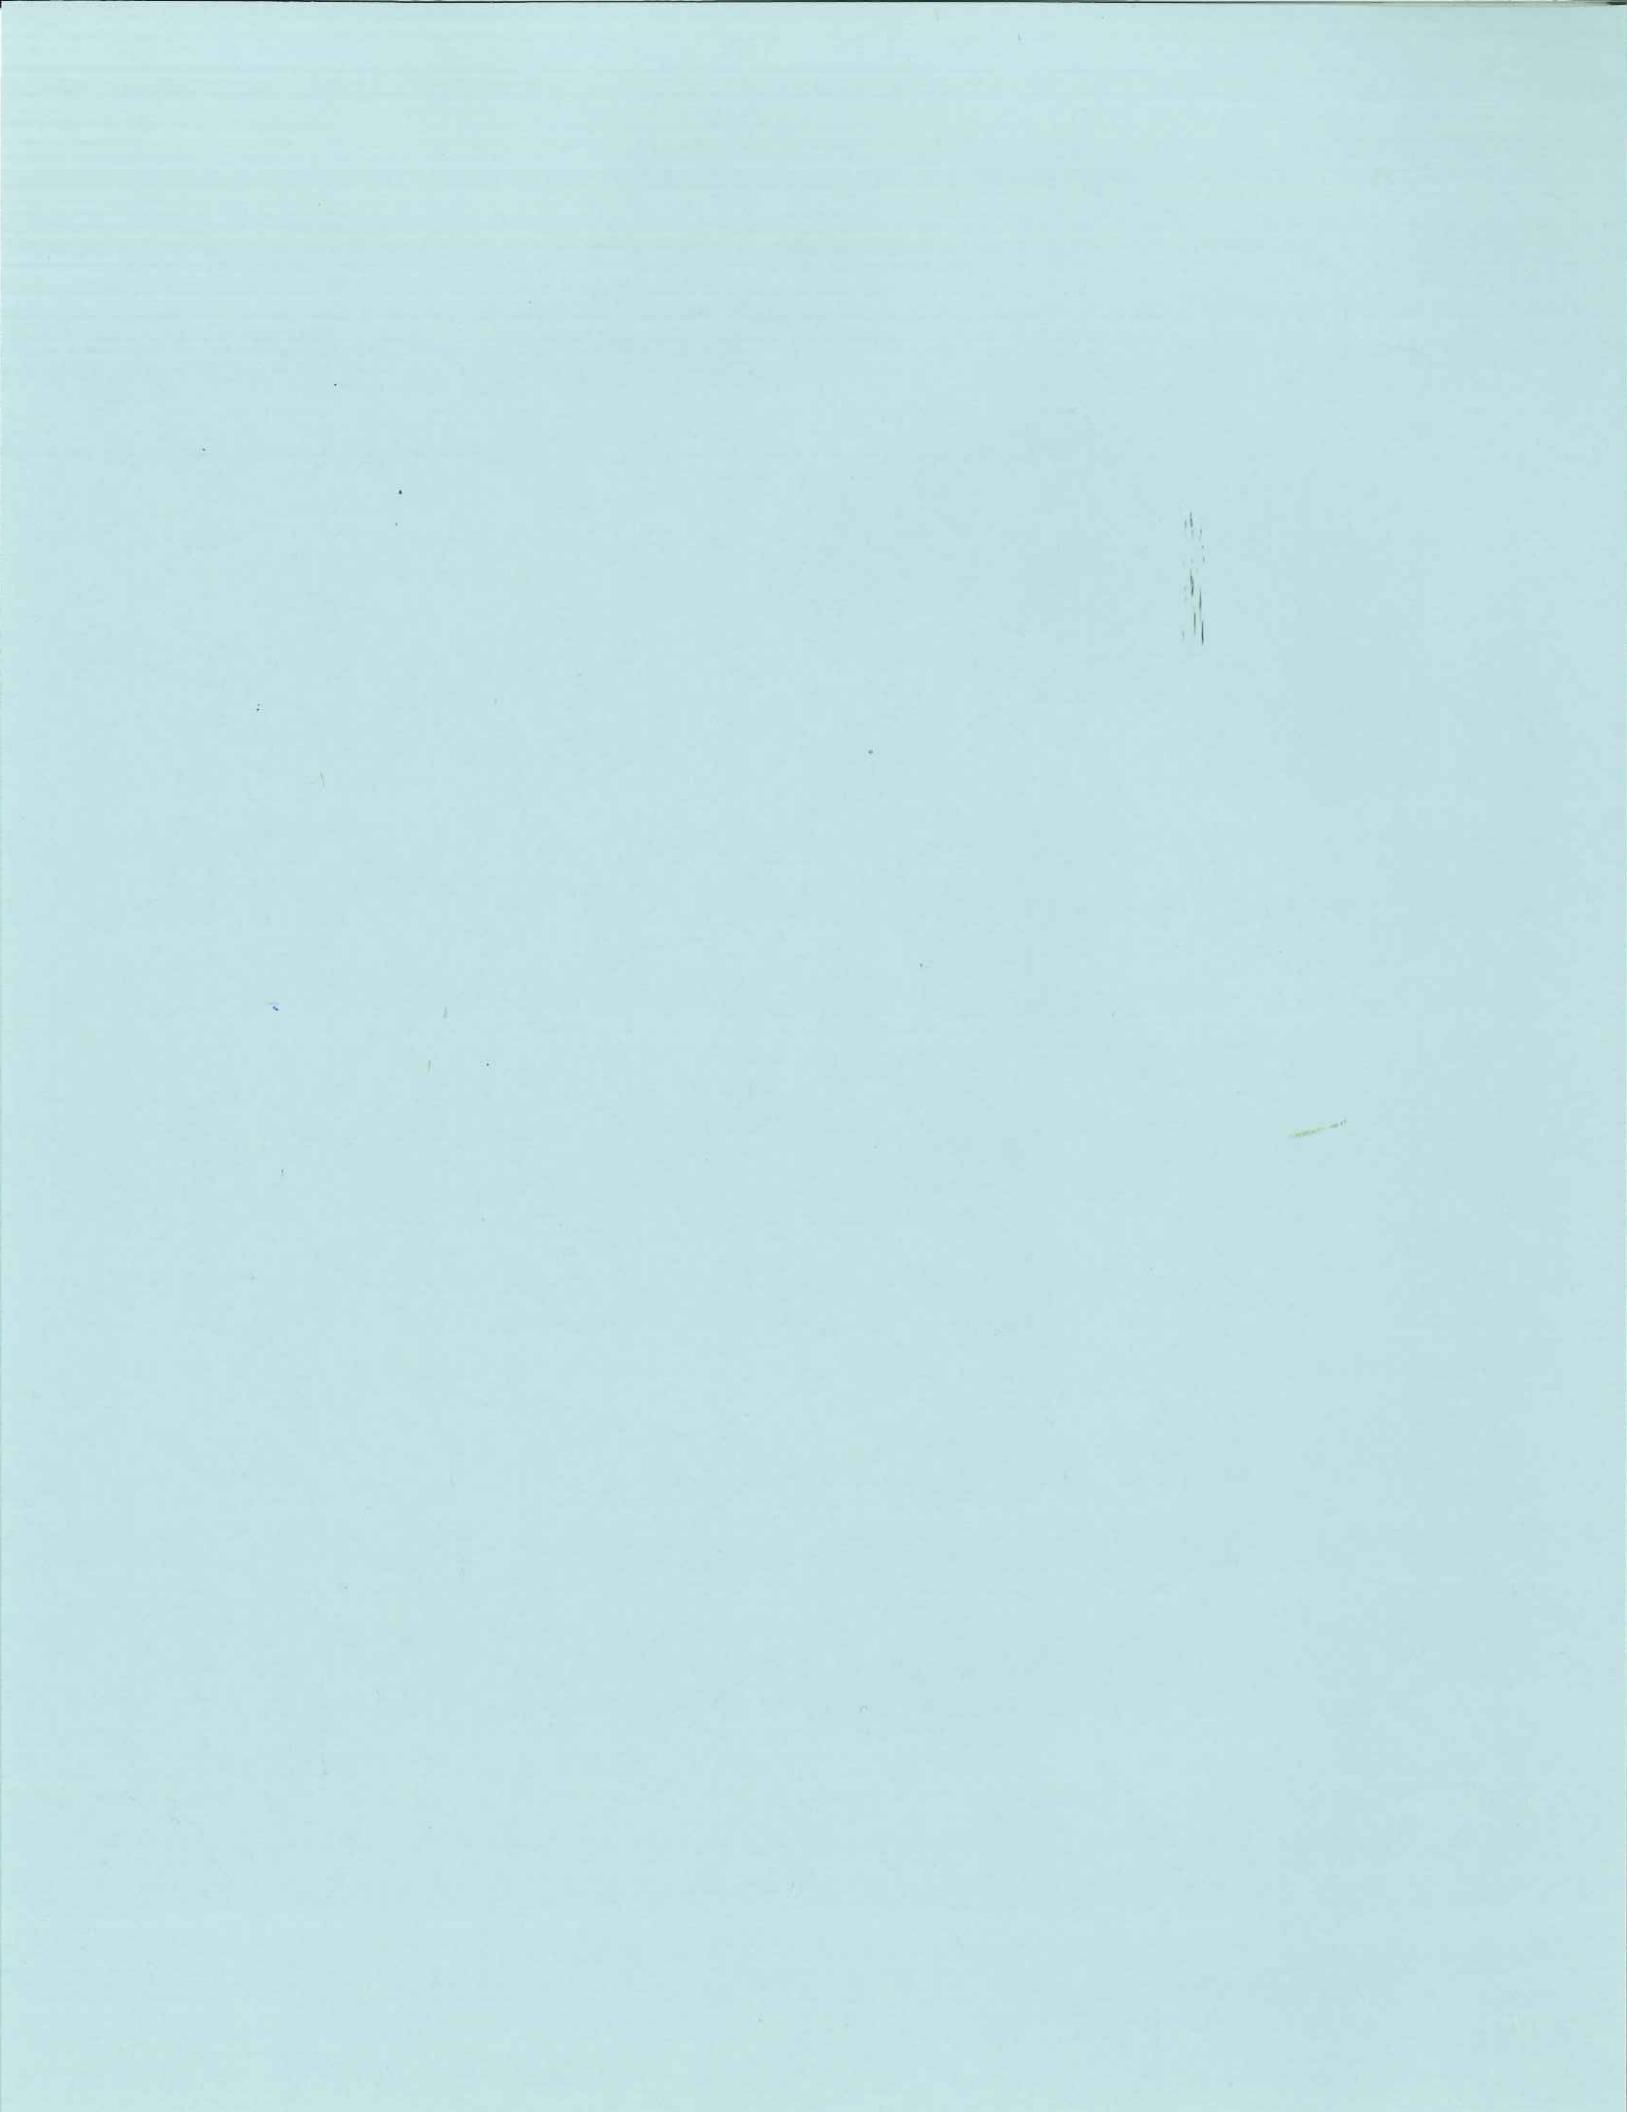

In general the chromatograms are fairly similar to each other. all appear to be typical of moderately weathered middle distillate, either diesel fuel or fuel oil. All indicate some biodegradation, the preferential removal of normal paraffins (labeled nC8 to nC27 on the TGI chromatogram) compared to the more biodegradation resistant isoprenoid peaks (labeled IP13, IP14, IP15, IP16, IP 18, Pristane and Phytane on the TGI chromatogram). The ratio of the height of the nC17 to the Pristane peak in fresh diesel fuel or fuel oil is about 2.1. The same ratio in the three samples is 1.4 (MW-14-TGI), 1.7 (MW-14) and 1.8 (MW-24). There also appears to be about a 25% loss of the more volatile components of all three samples due to evaporation and perhaps more likely the vapor extraction remediation being done at the site. The attached figure shows the effects of evaporation on diesel fuel evaporated in the laboratory.

A more detailed comparison of the 2009 and 2011 is not advisable due to the possibility that some minor differences could be due to differences between instruments and not due to chemical differences in the samples.

Please let me know if you have any questions or need anything else.

Subject: JAL Pump Station, NM
Attachments: Jal Pump Station Jal NM April 2011.xlsx; JAL Pump Station MW14 MW24 2011.pdf

Shailendra and Robyn,

The two samples from the JAL pump station in New Mexico are similar and contain diesel. Chromatograms area attached. The diesel is not significantly weathered with abundant n-alkanes. The table below and the attached Excel file include information on selected components and density. Also attached is information on relative boiling point/carbon number distribution (BPD tab).

Please let me know if you wish to discuss.

Regards,

Ileana
