#### II. Background

Safety and Environmental Solutions, Inc. (SESI) was engaged by OXY USA, INC to perform site assessment of and cleanup a release area at the West Dollarhide Devonian Unit #101 located in Section 33 of Township 24 South, Range 38 East, Lea County, New Mexico.

According to the C-141 dated January 9, 2014 the cause of release was a tank spilling over. The release was approximately 5 bbls of crude oil and 5 bbls of produced water. Approximately 3 bbls of crude oil and 3bbls of produced water were recovered.

#### III. Surface and Ground Water

The nearest groundwater of record is approximately 8.0 miles Northwest of the site. The New Mexico Office of State Engineer record is in Section 20 Range 38 East and Township 25 South. The reported depth was 75 feet below ground surface (BGS).

#### IV. Characterization

The target cleanup levels are determined using the *Guidelines for Remediation of Leaks, Spills and Releases* published by the NMOCD (August 13, 1993). Based on the ranking criteria presented below, the applicable Recommended Remediation Action Levels (RRAL) are 10 parts per million (ppm) Benzene, 50 ppm combined benzene, toluene, ethylbenzene, and total xylenes (BTEX), and 1000 ppm Total Petroleum Hydrocarbons (TPH).

#### V. Work Performed

BBC International Inc. was onsite to determine vertical extent of contamination. Samples were taken at site SP1 at the surface and at a depth of 1', 2', 3', 4' 6', 8', 10' and 12'. Samples were taken at site SP2 were taken at 1', 2', 4', 6', 8', 10' and 12'. All samples were properly packaged, preserved and transported to the Laboratory, Hobbs New Mexico and analyzed for Benzene, Toluene, Ethylbenzene, Xylenes, Total BTEX and

Chloride (Cl<sup>-</sup>) (Method SM4500Cl-B). The results of the analysis are presented in the table below:

The sample results indicate that the chloride concentration at 12' BGS is still between 2200ppm and 2600 ppm.

On March 20, 2014, BBC International Inc. was onsite to determine vertical extent of contamination using a coring rig. A bore hole was advanced to a depth of 55' BGS with samples taken a 15', 25', 25', 45' and 55'. All samples were properly packaged, preserved and transported to the Laboratory, Hobbs New Mexico and analyzed for Chloride (Cl<sup>-</sup>) (Method SM4500Cl-B). The results of the analysis are presented in the table below:

The sample results indicate that the vertical extent of contamination was determined to be between 45' & 55'.

On February 20, 2015 excavation began on the site. The site was excavated to a dwpth of approximately 2'. On March 4, 2015 SESI collected 14 field samples, (refer to photo below for sample points). The results of the field samples are presented in the table below:

#### VI. Action Plan

Due to the results listed above and the fact that this is an active location, the following action plan is proposed:

- 1. Excavate areas around NW SP-4, SW SP-2, NE SP-2 and SE SP-3 to the depth where the chloride concentrations are in the 500PPM range. Contaminated soil transport to an approved NMOCD facility for disposal. In the event that these areas do not reach the target of 500 PPM within 2' an impermeable liner will be installed in just that area. Otherwise, no liner will be installed for this site.
- 2. The excavated area will be backfilled with caliche and returned to grade.
- 3. A closure report and a final C-141 will be filed upon completion of the above work.
