**Re: 2014 Annual Facility-Wide Groundwater Monitoring Report, Navajo Refining Company, Lea Refinery, Lovington, New Mexico, AP-110.**

Dear Mr. Chavez:

Please find enclosed the original and one electronic copy of the *2014 Annual Facility-Wide Groundwater Monitoring Report* (Report) for the Navajo Refining Company (NRC) Lea Refinery (refinery) located in Lovington, New Mexico. The Report summarizes the results of groundwater monitoring activities conducted at the refinery under AP-110 during calendar year 2014.

If you should have any questions or comments regarding this Report, please feel free to contact me at (575) 746-5487 or Robert Combs at (575) 746-5382.

Sincerely,

Scott M. Denton  
Environmental Manager

## EXECUTIVE SUMMARY

This *2014 Annual Facility-Wide Groundwater Monitoring Report* documents groundwater monitoring activities conducted at the Lea Refinery (refinery) in Lovington, New Mexico during calendar year 2014. The monitoring objectives are to determine groundwater elevations, flow direction, and gradient and obtain dissolved-phase toxic pollutant concentration data.

The groundwater monitoring program consists of semi-annual groundwater gauging of wells, semi-annual groundwater sampling of wells, and annual reporting. The groundwater monitoring program also included monthly sampling of one refinery water supply well and holding tank until August 2014 when quarterly sampling of three refinery water supply wells was initiated instead in accordance with OCD's May 16, 2014, letter and Navajo Refining Company's (NRC's) response letter on June 20, 2014. Monitoring activities were conducted in general accordance with the Groundwater Discharge Permit (GW-014) issued by the New Mexico Oil Conservation Division (OCD). The OCD rescinded the Groundwater Discharge Permit on February 9, 2012, and the refinery is currently regulated under Abatement Plan (AP)-110). This *2014 Annual Facility-Wide Groundwater Monitoring Report* documents groundwater monitoring activities conducted in 2014 under AP-110, in accordance with NRC's February 22, 2013, Memorandum to the OCD.

The 2014 groundwater monitoring results indicate that physical and chemical groundwater conditions are generally consistent with historical data. The presence of select anions, total dissolved solids (TDS), and metals in select wells at concentrations above Water Quality Control Commission (WQCC) Human Health Standards is due to off-site sources, background concentrations, and/or non-NRC sources at the refinery.

NRC will continue to implement groundwater monitoring activities at the refinery in accordance with GW-014 during 2015 pending OCD approval of the forthcoming *Revised Facility-Wide Groundwater Monitoring Work Plan*.

No reportable releases occurred at the refinery during 2014.

## 1.0 INTRODUCTION

On behalf of The HollyFrontier Companies (HFC) and Navajo Refining Company (NRC), TRC Environmental Corporation (TRC) is submitting this *2014 Annual Facility-Wide Groundwater Monitoring Report* to summarize the results of groundwater monitoring activities conducted at the Lea Refinery (refinery) in Lovington, New Mexico during calendar year 2014. Previous annual monitoring reports were submitted in accordance with a Groundwater Discharge Permit (GW-014) issued by the New Mexico Oil Conservation Division (OCD). The Groundwater Discharge Permit was due to expire on October 30, 2011, and a renewal draft permit was issued in August 2011 that was to go into effect by November 1, 2011. However, the OCD rescinded the Groundwater Discharge Permit on February 9, 2012. The refinery is currently regulated by the OCD under Abatement Plan (AP)-110. This report is prepared in accordance with NRC's February 22, 2013, Memorandum to the OCD and OCD's response on February 28, 2013.

### 1.1 Refinery Description

The refinery is located approximately five miles south of Lovington in Lea County, New Mexico. The facility is operated by NRC and consists of refining operations and includes Holly Energy Partners – Operating, L.P. (HEP) pipeline and receiving stations. A refinery vicinity map is provided as Figure 1 and a refinery site plan is provided as Figure 2.

## 2.0 SEMI-ANNUAL GROUNDWATER MONITORING ACTIVITIES

Semi-annual groundwater monitoring activities were conducted at the refinery in February 2014 and August 2014. TRC conducted the first semi-annual groundwater monitoring event from February 24 to February 28, 2014, and the second semi-annual event from August 18 to August 21, 2014. Groundwater monitoring activities consisted of (1) gauging all refinery monitoring wells (MW-1 through MW-30) and one recovery well (RW-1), and (2) collecting groundwater samples for laboratory analysis from all refinery monitoring wells (MW-1 through MW-30), one recovery well (RW-1), and three water supply wells (WW-North, WW-South, and WW-East). The locations of the monitoring wells, recovery well, and water supply wells are presented in Figure 2.

The following deviations to the sampling and analysis plan presented in the rescinded Groundwater Discharge Permit (GW-014) were documented during the February 2014 monitoring event:

- Wells MW-11 and MW-14 were sampled using bailing techniques rather than low-flow procedures with a submersible pump due to poor recharge and insufficient water column in the well. These wells were purged dry with a new disposable bailer and a grab sample was collected for laboratory analysis after the well recharged.
- Wells MW-11 and MW-14 could only be sampled for volatile organic compounds (VOCs) due to poor recharge resulting in insufficient water volume.
- Water supply well WW-North was not in operation and could not be sampled.

The following deviations to the sampling and analysis plan presented in the rescinded Groundwater Discharge Permit (GW-014) were documented during the August 2014 monitoring event:

- Wells MW-11 and MW-14 were sampled using bailing techniques rather than low-flow procedures with a submersible pump due to poor recharge and insufficient water column in the wells. These wells were purged dry with a new disposable bailer and a grab sample was collected for laboratory analysis after the well recharged.
- Well MW-11 could only be sampled for VOCs, metals, and nitrate; and well MW-14 could only be sampled for VOCs, metals, nitrate, and total dissolved solids (TDS) due to insufficient water volume.

### 2.1 Fluid Level Gauging

All refinery monitoring and recovery wells were gauged during the February 2014 and August 2014 semi-annual monitoring events to determine the groundwater elevation, flow

direction, and gradient, the presence or absence of phase-separated hydrocarbons (PSH), and apparent PSH thickness. A decontaminated oil-water interface probe was used to measure depth to water and depth to PSH, if present. Depth to water and depth to PSH were measured to the nearest 0.01-foot from the top of the well casing.

## 2.2 Groundwater Sample Collection

Groundwater samples were collected for laboratory analysis from the following wells during the semi-annual monitoring events:

- February 2014: 30 refinery monitoring wells (MW-1 through MW-30), one recovery well (RW-1), and two water supply wells (WW-East and WW-South)
- August 2014: 30 refinery monitoring wells (MW-1 through MW-30), one recovery well (RW-1), and three water supply wells (WW-North, WW-East, and WW-South)

Except as identified as deviations above, each monitoring and recovery well was purged and sampled using low-flow sampling procedures. A stainless-steel, submersible pump (Proactive model SS-Monsoon) with a low-flow, electric controller and dedicated vinyl tubing or disposable, low-density polyethylene (LDPE) tubing was used for purging and sampling the monitoring wells and recovery well. The pump intake was placed at the middle of the water column because the water elevations were within the screened well intervals. A water-quality meter and turbidity meter were used to measure pH, temperature, conductivity, oxidation/reduction potential (ORP), dissolved oxygen, and turbidity at regular intervals during the purging process to obtain geochemical data and to monitor for stabilization of the groundwater. The purging process was considered complete when three of the six water quality parameters achieved stabilization.

The water supply wells were purged and sampled from a sampling point (i.e., tap or spigot) located at or near the well head or pump house and before the water supply is introduced into any storage tank or treatment unit. The wells were purged at the sample point to remove any standing water from the well casing and surface piping. Grab readings of geochemical parameters including pH, temperature, conductivity, ORP, dissolved oxygen, and turbidity were also collected during the purging process.

After the purging process was complete, groundwater samples were collected directly from the dedicated or disposable tubing (for the monitoring and recovery wells) or from the water supply well sampling point into method-specific containers provided by the laboratory. All groundwater samples were submitted to ALS Environmental Laboratory in Houston, Texas under appropriate chain-of-custody documentation for the following analyses, except as identified as deviations above:

- VOCs by Method SW8260
- Semi-volatile organic compounds (SVOCs) by Method SW8270
- Dissolved metals (aluminum, arsenic, barium, boron, cadmium, chromium, cobalt, copper, iron, lead, manganese, molybdenum, nickel, selenium, silver, uranium, zinc) by Method SW6020
- Total mercury by Method SW7470A
- Anions (chloride, fluoride, nitrate, nitrite, and sulfate) by United States Environmental Protection Agency (U.S. EPA) Method 300.0
- Alkalinity by Method SM2320B
- Specific conductivity by Method M2510 B
- TDS by Method M2540C

### 3.0 SEMI-ANNUAL GROUNDWATER MONITORING RESULTS

The results of the semi-annual groundwater monitoring activities conducted in February 2014 and August 2014 are discussed below.

#### 3.1 Fluid Gauging Results

Fluid level gauging was performed on February 24, 2014, and on August 18, 2014. Depth to water measurements and groundwater elevations are presented in Table 1. No PSH was detected in any monitoring or recovery well during either gauging event. Potentiometric groundwater surface maps for the February 2014 and August 2014 gauging events are presented as Figures 3 and 4, respectively. The groundwater elevations measured during both gauging events indicate groundwater flows radially (southeast, south, and north/northwest) towards a cone of depression near the three water supply wells located within the central portion of the refinery. This cone of depression is consistent with previous events and is induced by groundwater pumping from the three on-site water supply wells for refinery process use and non-potable restroom and safety shower use.

Groundwater elevations measured during the February 2014 event decreased an average 2.02 feet from those measured in February 2013. The February 2014 groundwater elevation data indicates groundwater beneath the northwestern portion of the refinery flows southeast towards the cone of depression at a hydraulic gradient ranging from 0.004 to 0.005 feet per foot. North of the cone of depression, groundwater flows south at a hydraulic gradient of 0.004 feet per foot. South/southeast of the cone of depression, groundwater flows north/northwest at a hydraulic gradient ranging from 0.002 to 0.004 feet per foot.

Groundwater elevations measured during the August 2014 event decreased an average 1.28 feet from those measured in August 2013. The August 2014 groundwater elevation data indicates groundwater northwest of the cone of depression flows southeast at a hydraulic gradient ranging from 0.008 to 0.010 feet per foot. North of the cone of depression, groundwater flows south/southwest at a hydraulic gradient of 0.009 feet per foot. South/southeast of the cone of depression, groundwater flows north/northwest at a hydraulic gradient ranging from 0.007 to 0.011 feet per foot. The increased hydraulic gradient observed in August 2014 near the cone of depression is caused by a decrease in the groundwater elevation measured at MW-18. The groundwater elevation measured at MW-18 in August 2014 decreased 10.31 feet from February 2014 and is the historical minimum groundwater elevation measured at the well.

A graph of groundwater elevations versus time for wells MW-4 and MW-6 is provided in Appendix A. As shown on the graph, groundwater elevations in wells MW-4 and MW-6 have decreased 5.70 feet and 6.58 feet, respectively, from June 2009 to August 2014. These reductions in groundwater are consistent across the refinery and are likely caused by (1) limited recharge

due to low rainfall levels and (2) active pumping from three on-site water supply wells and City of Lovington water supply wells located northwest and west (i.e., upgradient) of the refinery.

### **3.2 Groundwater Sampling Results**

Analytical results of organic and inorganic constituents in groundwater samples collected during the 2014 sampling events are presented in Tables 2 and 3, respectively. The analytical data are compared to the New Mexico Water Quality Control Commission (WQCC) Human Health Standards for groundwater and any results that exceeded these standards are shaded gray. Groundwater concentration maps are provided as Figures 5 to 12 for constituents that exceeded WQCC Standards. Laboratory analytical reports are provided in Appendix B. Plots of groundwater concentrations over time for detected constituents are provided in Appendix C.

#### **3.2.1 Organic Constituent Results**

Analytical results for VOCs and SVOCs (organic constituents) in groundwater are presented in Table 2. Naphthalene results are included in the VOC (SW8260) and SVOC (SW8270) sections of this report as it is reported by both analytical methods.

##### **3.2.1.1 Volatile Organic Compounds**

VOCs were not detected above the laboratory reporting limits in 32 of the 33 wells sampled during the February 2014 and August 2014 sampling events. VOCs were detected in monitoring well MW-11 as follows:

- Benzene was detected above the WQCC standard of 0.010 milligrams per liter (mg/L) during the February 2014 and August 2014 monitoring events at concentrations of 0.96 mg/L and 0.11 mg/L, respectively. The 2014 detected concentrations are lower than the historical maximum of 7.8 mg/L detected in MW-11 in February 2012. Benzene concentrations in well MW-11 will continue to be watched closely during future monitoring events. In addition, NRC proposes installation of oxygen-releasing compound (ORC®) socks in MW-11 to promote enhanced aerobic biodegradation of benzene in this well.
- Ethylbenzene was detected at concentrations below the WQCC standard of 0.75 mg/L during the February 2014 and August 2014 monitoring events.
- Xylene was detected at concentrations below the WQCC standard of 0.62 mg/L during the February 2014 and August 2014 monitoring events.
- Naphthalene was detected at a concentration below the WQCC standard of 0.03 mg/L during the February 2014 monitoring event.

Reported concentrations of VOCs during the 2014 sampling events were generally consistent with previous sampling results with no notable increases. Concentration maps of VOCs in groundwater for the February 2014 and August 2014 sampling events are provided as Figure 5 and Figure 6, respectively.

### **3.2.1.2 Semi-Volatile Organic Compounds**

SVOCs were not detected above the laboratory reporting limit in 28 of the 31 wells sampled for SVOCs during the February 2014 event nor in 31 of the 32 wells sampled for SVOCs during the August 2014 sampling event.

In February 2014, naphthalene and 1-methylnaphthalene were detected in monitoring well MW-6 at concentrations below the WQCC Standard of 0.03 mg/L for total naphthalenes. 1-methylnaphthalene had not previously been detected in well MW-6. In addition, phenol was detected in wells MW-18 and MW-19 at concentrations below the WQCC Standard of 0.005 mg/L for total phenols. Phenol had not previously been detected in wells MW-18 or MW-19.

In August 2014, naphthalene and 1-methylnaphthalene were detected in monitoring well MW-6 at concentrations below the WQCC Standard of 0.03 mg/L for total naphthalenes. Phenol was not detected in wells MW-18 and MW-19 in August 2014.

Reported concentrations of SVOCs during the 2014 sampling events were generally consistent with previous sampling results, with notable increases as described above in well MW-6. Well MW-6 will be watched closely during future monitoring events. Concentration maps of SVOCs in groundwater for the February 2014 and August 2014 sampling events are not provided because none of the reported concentrations exceeded the WQCC Standards.

## **3.2.2 Inorganic Constituent Results**

Analytical results for anions, TDS, and metals (inorganic constituents) in groundwater are presented in Table 3. A discussion of the inorganic constituent results is provided below.

### **3.2.2.1 Anions**

The February 2014 analytical results indicate that chloride and fluoride are present in groundwater at concentrations above their respective WQCC Standards. Chloride was detected at concentrations above the WQCC Standard of 250 mg/L in 8 of the 31 wells sampled with a maximum detected concentration of 588 mg/L in MW-13. Fluoride was detected at concentrations above the WQCC Standard of 1.6 mg/L in 2 of the 31 wells sampled with a maximum detected concentration of 2.28 mg/L in MW-24.

The August 2014 analytical results indicate that chloride and fluoride are present at concentrations above their respective WQCC Standards. Chloride was detected at concentrations above the WQCC Standard of 250 mg/L in 6 of the 32 wells sampled with a maximum detected

concentration of 485 mg/L in MW-13. Fluoride was detected at concentrations above the WQCC Standard of 1.6 mg/L in 3 of the 32 wells sampled with a maximum detected concentration of 2.76 mg/L in MW-24.

Concentration maps of anions that exceeded WQCC Standards in groundwater for the February 2014 and August 2014 sampling events are provided as Figures 7 and 8, respectively.

Reported anion concentrations for the 2014 sampling events were generally consistent with previous sampling results, with notable increases in the following wells:

- MW-9: Chloride concentrations increased from 35.7 mg/L in August 2013 to 197 mg/L in August 2014, which is the historical maximum reported at the well since. However, the chloride concentrations remain below the WQCC standard of 250 mg/L. Sulfate concentrations increased from 71.5 mg/L in February 2014 to 111 mg/L in August 2014, which is the historical maximum reported at the well. However, the sulfate concentrations remain below the WQCC standard of 600 mg/L.
- MW-10: Chloride concentrations increased from 95.0 mg/L in August 2013 to 156 mg/L in August 2014, which is the historical maximum reported at the well since June 2009. However, the chloride concentrations remain below the WQCC standard of 250 mg/L.
- MW-22: Fluoride concentrations increased from 0.416 mg/L in February 2014 to 1.00 mg/L in August 2014, which is the historical maximum reported concentration at the well. However, the fluoride concentrations remain below the WQCC standard of 1.6 mg/L. Sulfate concentrations increased from 85.2 mg/L in February 2014 to 127 mg/L in August 2014, which is the historical maximum reported at the well. However, the sulfate concentrations remain below the WQCC standard of 600 mg/L.

As discussed in the December 2013 *Refinery Investigation Report*, the presence of anions at concentrations above WQCC Standards in select wells, including fluoride (wells MW-3, MW-24, and MW-28) and chloride (wells MW-8, MW-13, MW-15, MW-19, MW-23, MW-25, MW-27, and WW-South), is due to off-site sources, background concentrations, and/or non-NRC sources at the refinery.

### **3.2.2.2 Total Dissolved Solids**

During the February 2014 sampling event, TDS was detected at concentrations above the WQCC Standard of 1,000 mg/L in 6 of the 31 wells sampled with a maximum detected concentration of 2,380 mg/L in well MW-13. During the August 2014 sampling event, TDS was detected at concentrations above the WQCC Standard of 1,000 mg/L in 6 of the 33 wells sampled with a maximum detected concentration of 1,900 mg/L in well MW-13. Concentration

maps of TDS in groundwater for the February 2014 and August 2014 sampling events are provided as Figures 9 and 10, respectively. Reported TDS concentrations for both 2014 sampling events were generally consistent with previous sampling results, with notable increases in the following wells:

- MW-9: TDS concentrations increased from 452 mg/L in February 2014 to 932 mg/L in August 2014, which is the historical maximum reported concentration at the well. However, the TDS concentration remains below the WQCC standard of 1,000 mg/L.
- MW-10: TDS concentrations increased from 516 mg/L in August 2013 to 750 mg/L in August 2014, which is the historical maximum reported concentration at the well. However, the TDS concentration remains below the WQCC standard of 1,000 mg/L.

As discussed in the December 2013 *Refinery Investigation Report*, the presence of TDS at concentrations above WQCC Standards in select wells (including wells MW-8, MW-13, MW-23, MW-25, MW-27, and WW-South) is due to off-site sources, background concentrations, and/or non-NRC sources at the refinery.

### 3.2.2.3 Metals

The February 2014 analytical results indicate that chromium, iron, and manganese were detected at concentrations above their respective WQCC Standards. Chromium was detected at a concentration above its WQCC Standard of 0.05 mg/L in well MW-29 at a concentration of 0.261 mg/L. Iron was detected at a concentration above its WQCC Standard of 1.0 mg/L in well MW-6 at a concentration of 3.42 mg/L. Manganese was detected at concentrations above the WQCC Standard of 0.2 mg/L in 4 of the 31 wells sampled with a maximum detected concentration of 2.71 mg/L in well MW-6.

The August 2014 analytical results indicate that aluminum, chromium, iron, manganese, and uranium were detected at concentrations above their respective WQCC Standards. Aluminum was detected above its WQCC Standard of 5.0 mg/L in well MW-22 at a concentration of 40.3 mg/L. Chromium was detected at concentrations above the WQCC Standard of 0.05 mg/L in 6 of the 34 wells sampled with a maximum detected concentration of 0.331 mg/L in well MW-29. Iron was detected at concentrations above the WQCC Standard of 1.0 mg/L in 3 of the 34 wells sampled with a maximum detected concentration of 4.32 mg/L in well MW-22. Manganese was detected at concentrations above the WQCC Standard of 0.2 mg/L in 4 of the 34 wells sampled with a maximum detected concentration of 3.06 mg/L in well MW-6. Uranium was detected at a concentration above its WQCC Standard of 0.03 mg/L in well MW-22 at a concentration of 0.0336 mg/L.

Concentration maps of metals that exceeded WQCC Standards in groundwater for the February 2014 and August 2014 sampling events are provided as Figures 11 and 12,

respectively. Metal exceedances present in groundwater beneath the wastewater separator, the former salt water disposal wells, and between Tanks 1214 and 1203, located within the northwestern/central portion of the Lea Refinery (i.e., wells MW-6, MW-7, MW-11, MW-13, MW-25, and MW-29), are generally consistent with previous sampling events, with the exception of well MW-9. Metals exceedances were detected in August 2014 in monitoring wells with no prior metals exceedances located in the south and southeast portions of the refinery (wells MW-12R, MW-22, and MW-24). Wells MW-9, MW-12R, MW-22 and MW-24 will be watched closely during future sampling events.

Reported metal concentrations for the 2014 sampling events were generally consistent with previous sampling results, with notable increases in the following wells:

- MW-6: Iron concentrations increased from <0.200 mg/L in August 2013 to 3.42 mg/L in February 2014, which is above the WQCC Standard and the historical maximum reported concentration at the well. The iron concentration in MW-6 decreased to 0.268 in August 2014, which is below the WQCC Standard. The historical trend of iron concentrations in MW-6 indicates fluctuating concentrations below and above the WQCC Standard likely related to seasonal recharge effects. This well will be watched closely during future sampling events.
- MW-7: Manganese concentrations increased from 0.365 mg/L in August 2013 to 0.781 mg/L in February 2014, which is the maximum reported concentration at the well. The manganese concentration in MW-7 decreased to 0.470 in August 2014, which is consistent with historical concentrations. The historical trend of manganese concentrations in MW-7 indicates fluctuating concentrations above the WQCC Standard likely related to seasonal recharge effects. This well will be watched closely during future sampling events.
- MW-9: Chromium concentrations increased from <0.0050 mg/L in February 2014 to 0.205 mg/L in August 2014, which is the historical maximum reported concentration and the first exceedance of the WQCC Standard at the well. Iron concentrations increased from <0.0050 mg/L in February 2014 to 2.22 mg/L in August 2014, which is the historical maximum reported concentration and the first exceedance of the WQCC Standard at the well. The August 2014 chromium and iron concentration are likely anomalous as these metals had not been detected in this well or were detected at significantly lower concentrations since it was installed in June 2009 and they were not detected during the most recent semi-annual monitoring event conducted in February 2015. This well will be watched closely during future sampling events.

- MW-12R: Chromium concentrations increased from <0.0050 mg/L in February 2014 to 0.0516 mg/L in August 2014, which is the historical maximum reported concentration and the first exceedance of the WQCC Standard at the well. The August 2014 concentration are likely anomalous as chromium had not been detected in this well since it was installed in August 2013 and it was not detected in the most recent sampling event conducted in February 2015. In addition, chromium was never detected in MW-12 (the damaged well replaced by well MW-12R). Possible sources of chromium in well MW-12R are nearby active oil production and injection wells located southwest, south, and southeast of MW-12R. This well will be watched closely during future sampling events.
- MW-13: Manganese concentrations increased from 0.705 mg/L in August 2013, which is above the WQCC Standard, to a historical maximum of 1.01 mg/L in February 2014. This well will be watched closely during future sampling events.
- MW-22: Aluminum concentrations increased from <0.010 mg/L in February 2014 to 40.3 mg/L in August 2014, which is the maximum reported concentration at the well and the first exceedance of the WQCC Standard for aluminum at the refinery. Chromium concentrations increased from 0.0133 mg/L in February 2014 to 0.184 mg/L in August 2014, which is the historical maximum reported concentration and first exceedance of the WQCC standard at the well. Iron concentrations increased from <0.200 mg/L in February 2014 to 4.32 mg/L in August 2014, which is the historical maximum reported concentration and first exceedance of the WQCC standard at the well. Uranium concentrations increased from 0.00632 mg/L in February 2014 to 0.0336 mg/L in August 2014, which is the historical maximum reported concentration and first exceedance of the WQCC Standard at the well.

The August 2014 aluminum, chromium, iron, and uranium concentrations in MW-22 are likely anomalous as these metals had not been detected in this well or were detected at significantly lower concentrations since the well was installed in August 2010 and the results of the most recent semi-annual monitoring event conducted in February 2015 were consistent with historical data. Possible sources of metals in well MW-22 include nearby active oil production and injection wells, particularly the active injection well LSAU-14, which is located approximately 150 feet northeast (upgradient) of MW-22. There are no identified refinery sources for metals in this well. This well will be watched closely during future sampling events.

- MW-24: Chromium concentrations increased from 0.0128 mg/L in February 2014 to 0.258 mg/L in August 2014, which is the maximum reported concentration and the first exceedance of the WQCC Standard at the well. Iron concentrations increased

from <0.200 mg/L in February 2014 to 1.28 mg/L in August 2014, which is the maximum reported concentration and the first exceedance of the WQCC Standard at the well. The August 2014 chromium and iron concentrations are likely anomalous as these metals had not been detected in this well or were detected at significantly lower concentrations since it was installed in August 2010 and they were not detected in this well during the most recent semi-annual monitoring event conducted in February 2015. Possible sources of metals in well MW-24 are nearby active oil production and injection wells located northeast, east, and southeast of MW-24. There are no identified refinery sources for metals in this well. This well will be watched closely during future sampling events.

- MW-25: Chromium concentrations increased from <0.005 mg/L in February 2014 to 0.185 mg/L in August 2014, which is above the WQCC Standard and the maximum reported concentration at the well. Chromium was also reported in exceedance of the WQCC Standard in this well in February 2011. The historical trend of chromium concentrations in MW-25 indicates fluctuating concentrations likely related to seasonal recharge effects. Chromium was detected at a historical minimum concentration in MW-25 during the most recent semi-annual monitoring event conducted in February 2015, which further indicates chromium concentrations fluctuate seasonally in MW-25. This well will be watched closely during future sampling events.
- MW-29: Chromium concentrations increased from 0.261 mg/L in February 2014 to 0.331 mg/L in August 2014, which is the maximum reported at the well since August 2010. The historical trend of chromium concentrations in MW-29 indicates fluctuating concentrations above the WQCC Standard likely related to seasonal recharge effects. Chromium results from the most recent semi-annual monitoring event conducted in February 2015 were consistent with February 2014 results, which further indicates chromium concentrations fluctuate seasonally in MW-29. This well will be watched closely during future sampling events.

As discussed in the December 2013 *Refinery Investigation Report*, the presence of metals at concentrations above WQCC Standards in select wells, including aluminum (well MW-22), chromium (wells MW-12R, MW-22, and MW-24), manganese (wells MW-11 and MW-13), iron (MW-22 and MW-24), and uranium (well MW-22), is due to off-site sources, background concentrations, and/or non-NRC sources at the refinery.

## 4.0 WATER WELL AND TANK SAMPLING AND ANALYTICAL RESULTS

The potential risk associated with use of the water in refinery restrooms and safety showers (the water is not used for drinking or cooking) was evaluated through sampling of the refinery water supply wells WW-North, WW-South, and WW-East. The results of the water supply well sampling activities conducted in 2014 are discussed below.

### 4.1 Monthly WW-East Sampling

Groundwater samples were collected from water supply well WW-East on a monthly basis from January to July 2014 (if the well was in operation) in accordance with July 2012 e-mail correspondence between NRC and OCD. The objective of the monthly sampling was to evaluate the potential risk associated with use of the water in refinery restrooms and safety showers (the water is not used for drinking or cooking). Water supply well WW-East was sampled monthly as it is the primary source of refinery water supply (i.e., the well operates approximately 70 to 80 percent of the time). Water supply wells WW-North and WW-South are used to supplement well WW-East (i.e., WW-North and WW-South each operate only 10 to 15 percent of the time) and were not sampled on a monthly basis from January to July 2014. A sample was not collected from WW-East in May 2014 because the well was not in operation during that month.

Groundwater samples collected from WW-East in January 2014 were submitted to ALS Environmental Laboratory in Houston, Texas. Groundwater samples collected from WW-East from February 2014 to July 2014 were submitted to Hall Environmental Analysis Laboratory in Albuquerque, New Mexico. All groundwater samples were submitted to the laboratory under chain-of-custody documentation for analysis of U.S. EPA Region 5 Skinner List of Constituents. Analytical results of the water supply well samples collected from WW-East are summarized in Table 4 and are compared to WQCC Standards and risk-based remediation goals (RBRGs) as determined in the December 2013 *Refinery Investigation Report*. None of the Skinner List constituents were detected at concentrations above their respective WQCC Standard or RBRG in any of the monthly samples. The water poses no risk associated with continued use in refinery restrooms and safety showers based on these results.

It should be noted that monthly sampling activities previously included the collection of samples from water supply holding tank Tank 1210, which was used to store water pumped from water supply wells WW-North, WW-South, and WW-East. This tank was shut down for maintenance in August 2013 and was not brought back into service before July 2014. Therefore, no samples were collected from Tank 1210 in 2014.

## 4.2 Quarterly Water Supply Well Sampling

Groundwater samples were collected from water supply wells WW-North, WW-South, and WW-East on a quarterly basis from August to December 2014 (if the wells were in operation) accordance with OCD's May 16, 2014, letter and NRC's response letter on June 20, 2014. Groundwater samples collected from the water supply wells were submitted to Hall Environmental Analysis Laboratory in Albuquerque, New Mexico under appropriate chain-of-custody documentation for the following analyses:

- VOCs by Method SW8260
- SVOCs by Method SW8270
- Dissolved metals (aluminum, arsenic, barium, boron, cadmium, chromium, cobalt, copper, iron, lead, manganese, molybdenum, nickel, selenium, silver, uranium, zinc) by Method SW6020
- Total mercury by Method SW7470A
- Anions (chloride, fluoride, nitrate, nitrite, and sulfate) by United States Environmental Protection Agency (U.S. EPA) Method 300.0
- Alkalinity by Method SM2320B
- Specific conductivity by Method M2510 B

Consistent with historical results, chloride was detected in WW-South at a concentration of 390 mg/L in December 2014, which exceeds the WQCC standard of 250 mg/L. None of the remaining analytes were detected at concentrations above their respective WQCC Standards in any of the samples. Organic and inorganic analytical results of the quarterly water supply well samples are summarized and compared to WQCC Standards in Tables 2 and 3, respectively. Water from the water supply wells poses no risk associated with continued use in refinery restrooms and safety showers based on these results.

## 5.0 QUALITY ASSURANCE/QUALITY CONTROL

### 5.1 Semi-Annual and Quarterly Groundwater Samples

Thirty-three water samples, four field duplicates, four trip blanks, and two equipment blanks were collected from February 24 to 28, 2014. Thirty-four water samples, four field duplicates, two equipment blanks, and two trip blanks were collected on from August 19 to 22, 2014. These samples were submitted to ALS Environmental Laboratory in Houston, Texas for analyses. Data for the following methods are reported:

- Chloride, fluoride, sulfate, and nitrate/nitrite by U.S. EPA Method 300.0
- Alkalinity by Standard Method (SM) 2320B
- Specific conductivity by SM 2510B
- pH BY SM4500H+B
- TDS by SM 2540C
- Dissolved metals by SW846 Method 6020
- Mercury by SW846 Method 7470
- VOCs by SW846 Method 8260
- Low-level SVOCs by SW846 Method 8270

On December 17, 2014, three groundwater samples, one field duplicate, and one trip blank were collected and submitted to Hall Environmental Analysis Laboratory in Albuquerque, New Mexico. Data for the following methods are reported:

- Chloride, fluoride, sulfate, and nitrate/nitrite by U.S. EPA Method 300.0
- Alkalinity by Standard Method (SM) 2320B
- Total and dissolved metals by SW846 Method 6020
- Mercury by SW846 Method 7470
- VOCs by SW846 Method 8260
- Low-level SVOCs by SW846 Method 8270

TRC Quality Assurance (QA) staff reviewed resultant data on March 12, 2015. Six separate data packages identified as work orders 14021211, 14030008, 14030092, HS14080747, HS14080845, and 1412926 were reviewed. Data were reviewed for compliance with the

analytical protocols used for sample analysis and laboratory-defined control limits. Items reviewed during the data validation process included the following:

- Sample integrity
- Blank analyses
- Spike recoveries
- Duplicate recoveries
- Sample documentation

Data interpretation issues are identified in the following subsections.

#### **5.1.1 Holding Times**

- Laboratory notes indicate that all pH analyses were performed outside of holding time. The method states that samples must be analyzed immediately. ALS interprets this to mean within 15 minutes of collection. Samples collected in February were analyzed within 3 days of collection. Samples collected in August were analyzed within 8 days of collection.

#### **5.1.2 Continuing Calibrations**

- Laboratory notes indicate that continuing calibration (CCV) percent differences (%D) were above the control limits for 2-chlorotoluene in batch R240229. This compound was not reported; therefore, there are no data interpretation issues associated with this high %D.
- Laboratory notes indicate that continuing calibration (CCV) percent differences (%D) were above the control limits for bromomethane in batch R239746. This compound was not detected in any of the associated samples; therefore, there are no data interpretation issues associated with this high %D.

#### **5.1.3 Surrogates**

- In February 2014, the surrogate recovery of 2-fluorobiphenyl in sample MW-18 was lower than laboratory-specified limits. 2-Fluorobiphenyl is a base-neutral surrogate. The following base-neutral SVOCs were detected in sample MW-18 and should be considered estimated with a low bias: acetophenone and bis(2-ethylhexyl)phthalate. The reporting limits for the remaining base-neutral SVOCs may be inaccurate or imprecise.

- In December 2014, the surrogate recovery of 1,2-dichloroethane-d4 in sample TB-12-17-14-01 was less than laboratory-defined limits. No VOCs were detected in this sample. Because this sample is a trip blank, there are unlikely to be any data interpretation issues associated with this low surrogate recovery.

#### **5.1.4 Blanks**

- In February 2014, the following compounds were detected in equipment blank EB-A-2-28-14: benzaldehyde and bicarbonate alkalinity. The following compounds were detected in equipment blank EB-B-2-28-14: benzaldehyde, bicarbonate alkalinity, and specific conductivity.
  - Benzaldehyde was not detected in any of the associated samples collected in February 2014; therefore, there are no data interpretation issues associated with these blank detections.
  - All specific conductivity detections in February 2014 were greater than five times the blank concentration; therefore, there are no data interpretation issues associated with this blank detection.
  - Bicarbonate alkalinity was detected in the following samples in February 2014 within five times the maximum blank concentration: MW-28, MW-15, DUP-1, MW-16, MW-4, MW-2, MW-5, MW-21, MW-22, MW-23, MW-20, MW-26, MW-10, MW-9, MW-3, MW-18, MW-19, DUP-3, DUP-4, MW-12R, MW-7, RW-1, MW-1, MW-6, MW-29, MW-30, MW-24, MW-13, MW-27, MW-8, MW-17R, and WW-South. Detected bicarbonate alkalinity concentrations in these samples may include measurement contributions from inadequate decontamination of field equipment.
- In August 2014, the following compounds were detected in equipment blank EB-08-21-14-A : acetone, acetophenone, benzaldehyde, bis(2-ethylhexyl)phthalate, dimethyl phthalate, aluminum, barium, calcium, chromium, nickel, sodium, and zinc. The following compounds were detected in equipment blank EB-08-22-14-A: carbon disulfide, benzaldehyde, bis(2-ethylhexyl)phthalate, aluminum, barium, calcium, chromium, magnesium, sodium, and zinc.
  - Acetophenone, benzaldehyde, and carbon disulfide were not detected in any samples collected in August 2014; therefore, there are no data interpretation issues associated with these blank detections.

- Acetone was detected in samples MW-23 and MW-4 in August 2014 at concentrations within ten times the blank concentration and may include measurement contributions from inadequate decontamination of field equipment.
- Calcium, magnesium, and sodium were not detected in any associated sample at concentrations within five times the blank concentration; therefore, there are no data interpretation issues associated with these blank detections.
- Bis(2-ethylhexyl)phthalate was detected in the following samples in August 2014 within ten times the blank concentration: MW-4, MW-3, MW-9, MW-10, MW-7, RW-1, MW-1, MW-6, MW-2, MW-13, MW-5, MW-28, MW-20, MW-21, and MW-18. Detected bis(2-ethylhexyl)phthalate concentrations in these samples may include measurement contributions from inadequate decontamination of field equipment.
- Dimethyl phthalate was detected in samples MW-7 and RW-1 in August 2014 at concentrations within ten times the blank concentration and may include measurement contributions from inadequate decontamination of field equipment.
- Barium was detected in sample MW-3 in August 2014 at a concentration within five times the blank concentration and may include measurement contributions from inadequate decontamination of field equipment.
- Chromium was detected in the following samples in August 2014 within five times the blank concentration: MW-23, MW-26, MW-15, MW-27, MW-8, WW-EAST, MW-30, MW-16, MW-5, MW-28, MW-19, MW-12R, MW-14, and MW-18. Detected chromium concentrations in these samples may include measurement contributions from inadequate decontamination of field equipment.
- Nickel was detected in the following samples within five times the blank concentration: MW-26, MW-6, MW-8, MW-30, MW-17R, MW-13, MW-16, MW-28, MW-19, DUP-1, MW-11, MW-12R, MW-14, and MW-18. Detected nickel concentrations for these samples in August 2014 may include measurement contributions from inadequate decontamination of field equipment.
- Zinc was detected in all samples at concentrations within five times the blank concentration in August 2014 except for MW-3 and MW-30 and may include measurement contributions from inadequate decontamination of field equipment.

### **5.1.5 Laboratory Control Sample/Laboratory Control Sample Duplicate (LCS/LCSD)**

- In February 2014, the RPDs for 4-Nitroaniline and pentachlorophenol in batch 77075 exceeded laboratory-defined control limits. These compounds were not detected in any associated samples; therefore, there are no data interpretation issues associated with these RPDs.
- In August 2014, the RPD of caprolactam exceeded laboratory-defined control limits in batch 85458. Caprolactam was detected in sample MW-4 and should be considered estimated.
- In August 2014, the RPDs of 2-chloronaphthalene and acenaphthene exceeded laboratory-defined control limits in batch 85507. 2-Chloronaphthalene was not detected in any of the associated samples. Acenaphthene was detected in samples MW-7 and RW-1 and should be considered estimated.

### **5.1.6 Matrix Spike/Matrix Spike Duplicate (MS/MSD)**

- In sample MW-26 in February 2014, recoveries of 2,6-dinitrotoluene exceeded laboratory-defined control limits. The RPD for 3,3'-dichlorobenzidine exceeded control limits in this sample. These compounds were not detected in this sample; therefore, no data interpretation issues are identified.
- In sample MW-29 in February 2014, the RPD for 3,3'-dichlorobenzidine exceeded laboratory-defined control limits. 3,3'-Dichlorobenzidine was not detected in this sample; therefore, no data interpretation issues are identified.
- Recoveries of several VOCs did not meet laboratory-defined limits in MS/MSD analyses in February 2014.
  - MW-26: The MS recovery of sec-butylbenzene was lower than laboratory-defined limits. Sec-butylbenzene was not detected in this sample, and it has not been historically detected in this sample; therefore, no data interpretation issues are associated with this MS recovery.
  - MW-3: The MS/MSD recoveries and RPD for chloroethane exceeded laboratory-defined limits. Chloroethane was not detected in this sample; therefore, no data interpretation issues are identified. MS and/or MSD recoveries for the following compounds were below laboratory-defined limits: 1,3,5-trimethylbenzene, 4-isopropyltoluene, carbon tetrachloride, n-butylbenzene, n-propylbenzene, sec-butylbenzene, and chloromethane. There were no historical detections of 1,3,5-trimethylbenzene, 4-isopropyltoluene, n-butylbenzene, n-propylbenzene, or sec-

butylbenzene; therefore, there are no data interpretation issues associated with these low recoveries. However, no historical data are available for carbon tetrachloride and chloromethane. The reporting limits may be inaccurate or imprecise.

- MW-29: The MS and/or MSD recoveries for the following compounds were lower than laboratory-defined limits: 1,1-dichloroethene, 1,3,5-trimethylbenzene, 4-isopropyltoluene, carbon tetrachloride, n-butylbenzene, n-propylbenzene, sec-butylbenzene, and tetrachloroethene. The RPDs of the following compounds exceeded control limits: carbon tetrachloride, n-butylbenzene, and sec-butylbenzene. None of these compounds were detected in sample MW-29. Historically, there were no detections of 1,3,5-trimethylbenzene, 4-isopropyltoluene, n-butylbenzene, n-propylbenzene, or sec-butylbenzene; therefore, there are no data interpretation issues associated with these recoveries and RPDs. Historical data for 1,1-dichloroethene, carbon tetrachloride, and tetrachloroethene are not available; therefore, the reporting limits may be inaccurate or imprecise.
- Recoveries of several VOCs did not meet laboratory-defined limits in MS/MSD analyses in August 2014.
  - WW-EAST: MSD recovery of 1,1,2,2-tetrachloroethane was greater than laboratory-defined limits. This constituent was not detected in WW-EAST; therefore, there are no data interpretation issues associated with this recovery.
  - RW-1: MS/MSD recoveries from chloromethane and vinyl chloride were less than laboratory-defined limits. These constituents were not detected in this sample and historical data are not available; therefore, the reporting limits may be inaccurate or imprecise.
  - DUP-4: MS/MSD recoveries of chloromethane and MSD recovery of vinyl chloride were less than laboratory-defined limits. These constituents were not detected in this sample and historical data are not available; therefore, the reporting limit may be inaccurate or imprecise.
  - MW-5: MSD recoveries of 1,3,5-trimethylbenzene, 4-isopropyltoluene, n-butylbenzene, n-propylbenzene, and sec-butylbenzene were less than laboratory-defined limits. There were no historical detections of these compounds; therefore, there are no data interpretation issues associated with these recoveries.

- The RPD for pentachlorophenol between MS/MSD analyses of MW-5 in August 2014 did not meet laboratory-defined limits. Pentachlorophenol was not detected in MW-5; therefore, there are no data interpretation issues associated with this RPD.
- Recoveries of metals did not meet laboratory-defined limits in the following samples from February 2014:
  - MW-26: the MS/MSD recoveries for calcium and sodium were lower than laboratory-defined limits; however, the sample detections were greater than four times the spike concentration. Therefore, there are no data interpretation issues associated with these recoveries.
  - MW-29: recoveries for calcium, chromium, and sodium were greater than laboratory-defined limits; however, the sample detections were greater than four times the spike concentration. Therefore, there are no data interpretation issues associated with these recoveries.
- Recoveries of metals did not meet laboratory-defined limits in the following samples from August 2014:
  - WW-EAST: The MS recovery for barium was lower than laboratory-defined limits. Barium results in all samples collected from August 2014 except for MW-5 should be considered biased low. Calcium and sodium recoveries were less than laboratory-defined limits; however, the spike concentrations were less than four times the sample concentration. There are no data interpretation issues associated with calcium and sodium.
  - MW-5: The MS/MSD recoveries and RPD for aluminum were outside of laboratory-defined limits. All aluminum results from August 2014 except for WW-EAST should be considered biased low. The MSD recovery for barium was below laboratory-defined limits. All barium results from August 2014 except for sample WW-EAST should be considered biased low. Recoveries for calcium and sodium did not meet laboratory-defined limits; however, spike concentrations were less than four times the sample concentration. There are no data interpretation issues associated with calcium and sodium.
- Recoveries of anions did not meet laboratory-defined limits in the following samples from February 2014:
  - MW-26: the MS/MSD recoveries for chloride and sulfate were outside laboratory-defined limits; however, the sample detections were greater than four times the

spike concentration. Therefore, there are no data interpretation issues associated with these recoveries.

- MW-29: the MS/MSD recoveries for chloride and sulfate were outside laboratory-defined limit; however, the sample detections were greater than four times the spike concentration. Therefore, there are no data interpretation issues associated with these recoveries. The MS recovery for fluoride was less than laboratory-defined limits; therefore, the fluoride detection in this sample should be considered estimated.
- MS/MSD recoveries of sulfate in sample WW-EAST in August 2014 were higher than laboratory-defined limits. Spike concentrations were greater than four times the sample concentrations; therefore, there are no data interpretation issues associated with these high recoveries.
- MS/MSD recoveries of nitrate/nitrite were lower than laboratory-defined limits in sample WW-EAST in August 2014. Nitrate/nitrite results should be considered estimated for all samples except for MW-3.
- MS/MSD recoveries for nitrate/nitrite in sample MW-3 in August 2014 exceeded laboratory-defined limits. The spike concentration was less than four times the sample concentration; therefore, there are no data interpretation issues associated with these high recoveries.
- In December 2014, MS/MSD recoveries for nitrite in sample DUP-1 were less than laboratory-defined limits. Nitrite was not detected in any sample from December 2014; therefore, the reporting limit may be inaccurate or imprecise.

#### **5.1.7 Laboratory Duplicates**

- The RPD for manganese and zinc in the laboratory duplicate analysis of the August 2014 sample WW-EAST exceeded laboratory control limits. August 2014 reported manganese results should be considered estimated in all samples except for MW-5.
- In February 2014, the RPD for zinc in sample MW-29 was greater than laboratory-defined limits. Zinc detections and non-detections should be considered estimated for all samples collected in February 2014 except for MW-26.

#### **5.1.8 Field Duplicates**

- In February 2014, the RPDs for the following samples did not meet control limits and detected concentrations should be considered estimated:
  - MW-29/DUP-2: zinc and total and bicarbonate alkalinity

- MW-19/DUP-3: aluminum and di-n-octyl phthalate
- MW-25/DUP-4: total and bicarbonate alkalinity
- In August 2014, the RPDs for aluminum, barium, manganese, nickel, and sodium in field duplicate pair MW-19/DUP-1 exceeded control limits. These detections should be considered estimated.
- Additional RPD values exceeded 20% and less than 60% in other field duplicate pairs; however, the detections were within five times the laboratory quantitation limit and are therefore not discussed further.

## 5.2 Monthly Water Well Samples

Six water samples and four trip blanks were collected on January 30, March 5, March 28, April 29, June 24, and July 28, 2014. These samples were submitted to ALS Laboratory Group in Houston, Texas for analyses. Data for the following methods are reported:

- Cyanide by SM Method 4500 CN E or U.S. EPA Method 335.4
- Metals by SW846 Method 6020
- Mercury by SW846 Method 7470
- VOCs by SW846 Method 8260
- Low-level SVOCs by SW846 Method 8270

TRC QA staff reviewed resultant data on March 12, 2015. Six separate data packages identified as work orders 1402100, 1403230, 1403C37, 1404B93, 1406B32, and 1407D13 were reviewed. Data were reviewed for compliance with the analytical protocols used for sample analysis and laboratory-defined control limits. Items reviewed during the data validation process included the following:

- Sample integrity
- Blank analyses
- Spike recoveries
- Duplicate recoveries
- Sample documentation

The following data interpretation issues were identified:

- Mercury was detected in the method blank for batch 12104 from the March 5, 2014 monthly sampling event. It was reported in sample East Water Well at 0.00011 J

mg/L and should be considered a potential false positive due to laboratory contamination.

- 2-Butanone was detected in the trip blank samples from the March 5, 2014 and July 28, 2014 monthly sampling events. 2-Butanone was not detected in the associated samples; therefore, there are no data interpretation issues associated with these detections.
- Trichloroethene was detected in the method blank for batch R18317 from the April 29, 2014 monthly sampling event. It was not detected in the associated sample; therefore, there are no data interpretation issues. Antimony was detected in method blank 13004 from the April 29, 2014 monthly sampling event. It was not detected in the associated sample; therefore, there are no data interpretation issues.
- Antimony was detected in the method blank for batch 13986 from the June 24, 2014 monthly sampling event. It was not detected in the associated sample; therefore, there are no data interpretation issues.
- 2-Butanone was detected in the method blank for batch R20215 from the July 28, 2014 monthly sampling event, but it was not detected in the associated sample. Therefore, there are no data interpretation issues associated with this detection.

## **6.0 2014 RELEASES AND REMEDIATION ACTIVITIES**

No reportable releases occurred at the refinery in 2014.

## 7.0 CONCLUSIONS

Conclusions based on data collected during groundwater monitoring activities conducted during calendar year 2014 are discussed below.

Groundwater flow directions were consistent with previous groundwater monitoring events. Groundwater elevations decreased an average 2.02 feet from February 2013 to February 2014 and from 1.28 feet August 2013 to August 2014. PSH was not detected in any monitoring wells. Groundwater elevations have continually decreased from June 2009 to August 2014. These reductions in groundwater are likely caused by limited recharge due to low rainfall levels and active pumping from on-site water supply wells and City of Lovington water supply wells located northwest and west (i.e., upgradient) of the refinery.

Benzene was detected above the WQCC standard during the February 2014 and August 2014 monitoring events in MW-11. Benzene concentrations in well MW-11 will be watched closely during future monitoring events. In addition, NRC will install ORC® socks in well MW-11 as an interim corrective action for elevated benzene concentrations in this well. No SVOCs were reported at concentrations above WQCC Standards in any well during either semi-annual monitoring event.

Anion exceedances of WQCC Standards reported during 2014 included chloride (in wells MW-8, MW-13, MW-15, MW-19, MW-23, MW-25, MW-27, and WW-South) and fluoride (in wells MW-3 and MW-24) in February 2014; and chloride (in wells MW-8, MW-13, MW-23, MW-25, MW-27, and WW-South) and fluoride (in wells MW-3, MW-24, and MW-28) in August 2014. The presence of select anions at concentrations above WQCC Standards in select wells is due to off-site sources, background concentrations, and/or non-NRC sources at the refinery.

TDS was reported at concentrations above its WQCC Standard in wells MW-8, MW-13, MW-23, MW-25, MW-27, and WW-South during the February 2014 and August 2014 semi-annual monitoring events. The presence of TDS at concentrations above WQCC Standards in select wells is due to off-site sources, background concentrations, and/or non-NRC sources at the refinery.

Metal exceedances of WQCC Standards reported during 2013 included chromium (in well MW-29), iron (in well MW-6), and manganese (in wells MW-6, MW-7, and MW-13) in February 2014; and aluminum (in well MW-22), chromium (in wells MW-9, MW-12R, MW-22, MW-24, MW-25, and MW-29), manganese (in wells, MW-6, MW-7, MW-11, and MW-13), and uranium (in well MW-22) in August 2014. The August 2014 metal results, particularly in wells MW-12R, MW-22, and MW-24, are anomalous compared to historical results and results of the most recent semi-annual monitoring event conducted in February 2015. The presence of select

metals at concentrations above WQCC Standards in select wells is due to off-site sources, background concentrations, and/or non-NRC sources at the refinery.

No constituents exceeded WQCC Standards in wells located along the southeastern refinery boundary (wells MW-5, MW-14, MW-12R, and MW-21), which is the natural downgradient portion of the facility (i.e., if active pumping from the on-site water supply wells ceased) with the exception of a chromium exceedance in MW-12R. The presence of chromium at concentrations above WQCC Standards in MW-12R is anomalous compared to historical results and results of the most recent semi-annual monitoring event conducted in February 2015. Groundwater pumping from refinery water supply wells WW-East, WW-North, and WW-South for industrial use causes radial groundwater flow towards a cone of depression at the central portion of the refinery preventing migration of constituents offsite, but also enables onsite migration of constituents from offsite sources (i.e., active oil production and injection wells).

WQCC Standards and RBRGs of Skinner List constituents were not exceeded in any of the monthly samples collected from water supply well WW-East. Chloride was detected in WW-South at a concentration of 390 mg/L in December 2014, which exceeds the WQCC standard of 250 mg/L. None of the remaining analytes were detected at concentrations above their respective WQCC Standards in any of the quarterly water supply well samples. Based on these results, the water poses no risk associated with continued use in refinery restrooms and safety showers.

## 8.0 WORK PLANNED FOR 2015

The following summarizes the scope of work planned for 2015 at the refinery:

- Continue to implement semi-annual groundwater monitoring and annual reporting activities in accordance with the sampling and analysis plan presented in the rescinded Groundwater Discharge Permit (GW-014), pending OCD review and approval of the forthcoming Revised FWGWMWP, which will be submitted in April 2015. NRC will continue to evaluate further reductions of the sampling plan based on historical analytical trends in groundwater.
- Continue to implement quarterly water supply well monitoring in accordance with OCD's May 16, 2014, letter and NRC's response letter on June 20, 2014.
- Implement interim corrective action of benzene in well MW-11 via installation of ORC® socks to promote enhanced aerobic biodegradation. The ORC® socks will be installed and maintained in accordance with manufacturer recommendations.

  2. WATER WELL COULD NOT BE SAMPLED BECAUSE IT WAS NOT IN OPERATION.
  3. ALL CONCENTRATIONS IN mg/L.
  4. CHROMIUM, IRON, AND MANGANESE SHOWN FOR ALL WELLS BECAUSE THEY ARE THE ONLY METALS THAT EXCEEDED THEIR RESPECTIVE WQCC STANDARDS.

**LABEL KEY:**  
**Cr: <0.00500 - CHROMIUM CONCENTRATION (WQCC STANDARD = 0.05 mg/L)**  
**Fe: <0.200 - IRON CONCENTRATION (WQCC STANDARD = 1.0 mg/L)**  
**Mn: <0.00500 - MANGANESE CONCENTRATION (WQCC STANDARD = 0.20 mg/L)**  
  
**HIGHLIGHTED NOTES IN EXCEEDANCE OF WQCC STANDARD.**

NOTES:  
1. WATER WELL COULD NOT BE SAMPLED BECAUSE IT WAS NOT IN OPERATION.  
2. WELL COULD NOT BE SAMPLED DUE TO INSUFFICIENT VOLUME.  
3. ALL CONCENTRATIONS IN mg/L.  
4. CHROMIUM, IRON, MANGANESE, URANIUM AND ALUMINUM ARE SHOWN FOR ALL WELLS BECAUSE THEY ARE THE ONLY METALS THAT EXCEEDED THEIR RESPECTIVE WQCC STANDARD.

**LABEL KEY:**  
**Cr: <0.00500 - CHROMIUM CONCENTRATION (WQCC STANDARD = 0.05 mg/L)**  
**Fe: <0.200 - IRON CONCENTRATION (WQCC STANDARD = 1.0 mg/L)**  
**Mn: <0.00500 - MANGANESE CONCENTRATION (WQCC STANDARD = 0.20 mg/L)**  
**U: <0.00300 - URANIUM CONCENTRATION (WQCC STANDARD = 0.03 mg/L)**  
**Al: <0.05 - ALUMINUM CONCENTRATION (WQCC STANDARD = 5.0 mg/L)**

**HIGHLIGHTED NOTES IN EXCEEDANCE OF WQCC STANDARD.**

Notes:

1. Monitoring wells MW-1 through MW-7 installed September 1995; plugged and redrilled April 2009.
2. Monitoring wells MW-8 through MW-10 installed March and April 1996; plugged and redrilled April 2009.
3. Monitoring wells MW-6R, MW-11, MW-12 installed April and May 2002; MW-6R plugged April 2009.
4. Monitoring wells MW-13 and MW-14 installed January 2004.
5. Elevation survey of new and existing wells August 7, 2009. Earlier water level information corrected to current survey.
6. Monitoring wells MW-15 through MW-29 installed May-June 2010.
7. Elevation survey of wells MW-15 through MW-29 July 13, 2010.
8. Monitoring wells MW-12R, MW-17R, and MW-30 installed June 2013; MW-12 and MW-17 plugged and abandoned June 2013.

**Notes:**

Shading indicates detected result exceeded the New Mexico Water Quality Control Commission (WQCC) Human Health Standard

mg/L = milligrams per liter

&lt; = Not reported above laboratory reporting limit

-- = Not Analyzed

<sup>(1)</sup> Not analyzed due to insufficient water volume

June 2009 to August 2014 analyses performed by ALS Laboratory Group, Houston, Texas

December 2014 analyses performed by Hall Environmental Analysis Laboratory in Albuquerque, New Mexico

**Table 3. Inorganic Constituent Concentrations in Groundwater**

Table 3. Inorganic Constituent Concentrations in Groundwater, Navajo Refining Company, Lea Refinery, Lovington, NM

| Monitor Well        | Sample Date | Chloride (mg/L) | Fluoride (mg/L) | Nitrate-Nitrite (as N, mg/L) | Sulfate (mg/L) | Total Dissolved Solids (mg/L) | Aluminum (mg/L) | Arsenic (mg/L) | Barium (mg/L) | Boron (mg/L) | Cadmium (mg/L) | Chromium (mg/L) | Cobalt (mg/L) | Copper (mg/L) | Iron (mg/L) | Lead (mg/L) | Manganese (mg/L) | Total Mercury (mg/L) | Molybdenum (mg/L) | Nickel (mg/L) | Selenium (mg/L) | Silver (mg/L) | Uranium (mg/L) | Zinc (mg/L) |

Re: Lovington Lea Refining-Skinner List

Work Order: **1402100**

Dear Aaron,

ALS Environmental received 2 samples on 31-Jan-2014 08:53 AM for the analyses presented in the following report.

The analytical data provided relates directly to the samples received by ALS Environmental and for only the analyses requested. Results are expressed as "as received" unless otherwise noted.

QC sample results for this data met EPA or laboratory specifications except as noted in the Case Narrative or as noted with qualifiers in the QC batch information. Should this laboratory report need to be reproduced, it should be reproduced in full unless written approval has been obtained by ALS Environmental. Samples will be disposed in 30 days unless storage arrangements are made.

The total number of pages in this report is 25.

If you have any questions regarding this report, please feel free to call me.

Sincerely,

A handwritten signature in black ink that reads "Sonia West".

Electronically approved by: Dayna.Fisher

Re: Navajo Lea Refinery Semi-Annual

Work Order: **14021211**

Dear Robert,

ALS Environmental received 18 samples on 26-Feb-2014 09:45 AM for the analyses presented in the following report.

The analytical data provided relates directly to the samples received by ALS Environmental and for only the analyses requested. Results are expressed as "as received" unless otherwise noted.

QC sample results for this data met EPA or laboratory specifications except as noted in the Case Narrative or as noted with qualifiers in the QC batch information. Should this laboratory report need to be reproduced, it should be reproduced in full unless written approval has been obtained by ALS Environmental. Samples will be disposed in 30 days unless storage arrangements are made.

The total number of pages in this report is 140.

If you have any questions regarding this report, please feel free to call me.

Sincerely,

A handwritten signature in black ink that reads "Sonia West".

Electronically approved by: Jumoke M. Lawal

**Case Narrative**

As per client's email on February 28, 2014, samples AC-2-25-14-A & AC-2-25-14-B were cancelled and put on hold.

Sample received outside method holding time for pH. pH is an immediate test. Sample results are flagged with an "H" qualifier.

Batch 77079, Dissolved Metals 6020, Sample MW-26 (14021211-13D): MS/MSD recoveries are outside of the control limits due to matrix interference.

Batch 77075, Semivolatile Organics 8270, Sample SLCSDW1-140228: The LCSD RPD was above the control limits for 4-nitroaniline and Pentachlorophenol. The LCS and LCSD recoveries were within the control limits.

Batch 77075, Semivolatile Organics 8270, Sample MW-26 (14021211-13F): The MS and/or MSD recoveries were outside of the control limits for 2,6-dinitrotoluene due to matrix interference. The LCS and LCSD recoveries were within the control limits.

Batch 77075, Semivolatile Organics 8270, Sample MW-26 (14021211-13F): The MSD RPD for 3,3'-dichlorobenzidine was outside of the control limits. The MS/MSD recoveries were within the control limits.

Batch R162237, Volatile Organics 8260, Sample MW-3 (14021211-17A): MS/MSD recoveries and RPD's are outside of the control limits for several compounds due to matrix interference.

Batch R162751, Anions, Sample MW-26 (14021211-13E): MS/MSD recoveries for Chloride and Sulfate were outside of the control limits due to matrix interference.

Re: Navajo Lea Refinery Semi-Annual

Work Order: **14030008**

Dear Robert,

ALS Environmental received 22 samples on 01-Mar-2014 09:45 AM for the analyses presented in the following report.

The analytical data provided relates directly to the samples received by ALS Environmental and for only the analyses requested. Results are expressed as "as received" unless otherwise noted.

QC sample results for this data met EPA or laboratory specifications except as noted in the Case Narrative or as noted with qualifiers in the QC batch information. Should this laboratory report need to be reproduced, it should be reproduced in full unless written approval has been obtained by ALS Environmental. Samples will be disposed in 30 days unless storage arrangements are made.

The total number of pages in this report is 174.

If you have any questions regarding this report, please feel free to call me.

Sincerely,

A handwritten signature in black ink that reads "Sonia West".

Electronically approved by: Sonia West

---

**Case Narrative**

Two sets of Trip Blanks were received but only one set was listed on the chain of custody. The lab analyzed both samples. Sample MW-27 had 1 of 3 vials broken in the lab. Also, sample MW-29 had 1 of 2 amber 1 liter bottles broken in the lab. Sufficient sample volumes remained for analysis.

Sample received outside method holding time for pH. pH is an immediate test. Sample results are flagged with an "H" qualifier.

Batch 77152, Semivolatile Organics by method 8270, Sample MW-18 (14030008-01F): The surrogate recovery for 2-Fluorobiphenyl was outside of the control limits.

Batch 77235, Dissolved Metals by method 6020, Sample MW-29 (14030008-11D): MS and/or MSD recoveries for Calcium, Chromium and Sodium were outside of the control limits due to matrix interference. The LCS and DUP were within the control limits. Results were confirmed by re-analysis.

Batch 77152, Semivolatile Organics by method 8270, Sample MW-29 (14030008-11F): The analyte 3,3'-dichlorobenzidine did not meet precision criteria (%RPD). The associated LCS, MS and MSD recovered within acceptance criteria.

Batch R162237, Volatile Organics by method 8260, Sample 14021211-17A: MS/MSD are for an unrelated sample.

Batch R162271, Volatile Organics by method 8260, Sample MW-29 (14030008-11A): MS/MSD recoveries were outside control limits for almost all analytes and several analytes did not meet precision criteria (%RPD). The associated LCS recovered within acceptance criteria.

Batch R162903, Anions by method 300, Sample MW-29 (14030008-11E): MS/MSD recoveries were outside control limits for Chloride, Fluoride and Sulfate due to matrix interference. The associated LCS recovered within acceptance criteria.
