NATURE OF RELEASE

Type of Release: Crude Oil and produced Water Spill	Volume of Release: 8.6 bbls fluid	Volume Recovered: Unknown
Source of Release: Flow Line	Date and Hour of Occurrence: 01/24/12 10:45 AM	Date and Hour of Discovery: 01/24/12 11:00 AM
Was Immediate Notice Given? ☒ Yes ☐ No ☐ Not Required	If YES, To Whom? Mr. Leking via voicemail	
By Whom? David Pagano	Date and Hour:	
Was a Watercourse Reached? ☐ Yes ☒ No	If YES, Volume Impacting the Watercourse.	

If a Watercourse was Impacted, Describe Fully.*
N/A

Describe Cause of Problem and Remedial Action Taken.*

It appears someone drove around wellhead and snagged out poly gas line, causing 8.6 bbls fluid spill, mostly oil with a small amount of produced water. Chemical rep notified pumper of spill to land at 10:45 and pumper immediately drove to well and shut well in to contain release. Well shut in at approximately 11:00 AM.

Describe Area Affected and Cleanup Action Taken.*

Approx. 8.6 bbls of fluid mostly oil spilled on pad and worked its way to the road as well as foot wide path that ran into the pasture. Vacuum truck vacuumed up standing liquid on pad and road. Chevron received Archeological/wildlife clearance from BLM. Backhoe excavated contaminated soil on pad and road and contaminated soil was taken offsite for disposal. Spray off of pad into the pasture was remediated by knocking off fluids from vegetation using biodegradable soap, and then used micro blaze to remediate contaminated soil.

Two discrete soil confirmation samples were collected from the base of the excavation before the excavated area was reportedly backfilled with imported soils. These sampling results indicated the presence of chloride concentrations in shallow soils at levels of regulatory concern.

In response to these results, an additional site assessment was conducted to confirm the extent of soil impacts.

Analytical results of the additional assessment are attached.

I hereby certify that the information given above is true and complete to the best of my knowledge and understand that pursuant to NMOCD rules and regulations all operators are required to report and/or file certain release notifications and perform corrective actions for releases which may endanger public health or the environment. The acceptance of a C-141 report by the NMOCD marked as "Final Report" does not relieve the operator of liability should their operations have failed to adequately investigate and remediate contamination that pose a threat to ground water, surface water, human health or the environment. In addition, NMOCD acceptance of a C-141 report does not relieve the operator of responsibility for compliance with any other federal, state, or local laws and/or regulations.

Subject:

Site Assessment Report
Skelly Unit #936
Eddy County, New Mexico

Dear Mr. Welch:

On behalf of Chevron Environmental Management Company (CEMC), ARCADIS U.S., Inc. (ARCADIS) prepared this Site Assessment Report (report) to document cleanup actions and soil sampling activities performed in response to a release of approximately 8.6 barrels (bbls) of oil mixed with a small quantity of produced water that occurred at the Skelly Unit (SKU) #936 located in Eddy County, New Mexico (site; Figure 1).

To evaluate the potential for this release to impact groundwater, a Site Conceptual Model was developed (Attachment 1). Potential impacts to groundwater are not considered possible due to the following:

- The volume of material released was relatively small (8.6 total bbls);
- Response activities included removal of liquids and impacted surface soil;
- Local climatic conditions are not conducive to leaching due to low rainfall and high evapotranspiration;
- The presence of a caliche layer impedes the vertical migration of liquids; and
- Groundwater is encountered at significant depth (263 feet below ground surface).
- Based on geochemical modeling using USEPA Multimedia Exposure Assessment Model (MULTIMED) Version 2.0 (USEPA 1996), a significantly larger release would be necessary to cause an exceedance of regulatory criteria in groundwater.

Imagine the result

This report describes spill response activities for a release that occurred on January 24, 2012 and follow-up soil assessment activities that occurred on November 4 and 5, 2013.

Background Information

This section summarizes the site location and description, as well as the regional setting including geology, hydrogeology, nearby drinking water wells, surface water, and climate.

Site Location and Description

The site is located within the Chevron-operated Vacuum Unit approximately 30 miles southeast of Artesia, New Mexico. New Mexico Highway 82 (Lovington Highway) is located approximately 0.8 mile south of the site.

The site is located in the western edge of the Permian Basin, a 75,000-square-mile area in west Texas and New Mexico that is populated by numerous oil and gas production wells. In New Mexico, the Permian Basin is bounded by the Texas state lines to the south and east, by Roosevelt County to the north, and Chavez County to the west. Artesia (the closest town) is approximately 30 miles northwest of the site and the closest agricultural area is more than 25 miles west of the site.

The site is located directly north of the SKU #936 wellhead. The release described below occurred mostly on the well pad. A photolog of the site is included as Attachment 2.

Nearby Water Wells and Surface Water

In November 2013, ARCADIS field verified that no surface-water bodies are located within 1,000 feet of the site. Based on satellite imagery, no surface-water bodies were identified within 3 miles of the site (GoogleEarth 2014).

In June 2014, ARCADIS reviewed information obtained from the New Mexico Office of the State Engineer (NMOSE) online database (NMOSE 2011), which indicates that no water-supply wells are located within 1,000 feet of the site. The NMOSE online database identified four petroleum-industry-related water-supply wells (NMOSE 2011). A petroleum-industry-related water supply well, located approximately 2.1 miles south (i.e., hydraulically crossgradient) of the site was identified as the closest well to the site.

Climate

Monthly average temperatures near the site vary from a minimum of 23.5 degrees Fahrenheit (°F) in January to a maximum of 94.8°F in July (Western Regional Climate Center (WRCC) Artesia, New Mexico (290600) weather station). Total average precipitation in the area of the site recorded from the available WRCC period of record between 1914 and 2005 was approximately 11.90 inches per year (WRCC 2014a).

Due to the arid climate, the site experiences low precipitation and high evapotranspiration rates. The total average evapotranspiration from the available WRCC period of record between 1914 and 2005 was approximately 87.68 inches per year (WRCC 2014b).

Regional Geology and Hydrogeology

The site elevation is approximately 3,750 feet above mean sea level and is located in the Querecho Plains immediately west of the Mescalero Ridge, which demarcates the western boundary of the (Miocene to Pliocene) High Plains Ogallala Formation (Reeves 1972; and Nicholson and Clebsch 1961). A rapid drop in elevation of 200 to 250 feet occurs west of the northwest-trending Mescalero Ridge, located approximately 6 miles northeast of the site.

The Querecho Plain is 80 percent covered by a moderately stable dune field (Reeves 1972) that is deposited on top of Triassic Dockum red beds. The red bed surface, which is 400,000 to 500,000 years old, is relatively flat with minor erosional incisions in an area of regionally variable topography in the context of the Mescalero Ridge and an elongate, southwestward-trending depression associated with the Cedar Lake Draw. The site is located in the headwaters of the draw. The red beds in the area typically have a 3- to 13-foot-thick near-surface caliche layer (Bachman 1980). The stabilized dune field is deposited on this surface.

Deposition of sand and the formation of the dune field began 60,000 years ago, with additional development beginning 9,000 years ago (Hall 2002). The surface and interior of these dunes do not contain caliche; however, a 1-foot layer of caliche is common at the bottom of the dunes at the contact with the red bed surface.

Groundwater near the site is encountered in the Dockum Group, at a depth of approximately 263 feet bgs (NMOSE 2014; Attachment 3). Compared to the Ogallala Formation to the west of the site, the Dockum Group groundwater is not a major

resource in the area, with poor potential water production rates and elevated natural dissolved solids.

Water supply wells in central Eddy County and near the site, as discussed in the Nearby Water Wells and Surface Water section of this report, are completed in underlying Triassic age sandstone units of the Dockum Group that outcrop on the surface of the Querecho Plains in this area. Based on topography, with the surface elevation dropping from 3,750 feet to 3,320 feet at the Pecos River 33 miles to the west-southwest, the regional groundwater flow direction is most likely to the west-southwest towards the Pecos River.

Initial Release Response Activities

A release of approximately 8.6 bbls of oil mixed with a small quantity of produced water occurred at the site on January 1, 2012 due to a release from a high-density polyethylene gas line. Chevron personnel from the Mid-Continent Business Unit (MCBU) stopped the release and recovered an unknown quantity of fluids using a vacuum truck. Chevron MCBU personnel excavated visually impacted soil in the area to a depth of approximately 2 feet bgs and collected two discrete confirmation soil samples from the base of the excavation on May 7, 2012. Information regarding the disposal of the excavated soil was not available to ARCADIS. After collecting the soil samples, the excavated area was reportedly backfilled with imported soil.

Pursuant to New Mexico Oil Conservation Division (NMOCD) requirements (NMOCD 1993), a Notification of Release and Correction (Form C-141) detailing the location, volume of release, and initial and planned cleanup efforts taken was submitted for the site by David Pagano with Chevron MCBU. The original and updated C-141 forms are included as Attachment 4.

Confirmation Soil Sampling

Two discrete confirmation soil samples were collected from the base of the excavation on May 7, 2012. In accordance with the laboratory analytical report (Attachment 5), soil sample containers were transported, on ice, under chain of custody procedures to Cardinal Laboratories Environmental Analytical Services for the following analyses:

- Benzene, toluene, ethylbenzene, and xylene (BTEX) by United States Environmental Protection Agency (USEPA) Method 8021B

- Total petroleum hydrocarbons as gasoline range organics (TPH-GRO) and total petroleum hydrocarbons as diesel range organics (TPH-DRO) by USEPA Method 8015M
- Chloride by USEPA Method SM4500Cl-B

Confirmation soil sample results are presented in Table 1. The complete laboratory analytical results with chain of custody documentation are included in Attachment 5.

Data Evaluation Approach

Chevron MCBU personnel compared data from the two May 2012 confirmation soil samples to regulatory criteria to provide context for the concentrations of analytes detected and to evaluate if additional sampling was necessary. The regulatory criteria selected are based on potential receptors near the site and consist of the following:

- NMOCD risk-based soil remediation action levels (SRALs) for benzene, total BTEX, and total petroleum hydrocarbons (TPH) for leaks, spills, and releases (NMOCD 1993). SRALs were calculated using the NMOCD criteria presented in the tables below.

Criteria	Site-Specific Result	Ranking Score
Depth to groundwater	>100 feet	0
Wellhead protection area	No	0
Distance to surface-water body	>1,000 feet	0
Total Ranking Score		0

SRALs	Benzene (mg/kg)	Total BTEX (mg/kg)	TPH (mg/kg)
	10	50	5,000

Note:

mg/kg = milligrams per kilogram

- New Mexico Administrative Code (NMAC) closure criteria for soil beneath belowgrade tanks, drying pads associated with closed-loop systems, and pits where contents are removed (NMAC 2009).

Criteria	Site-Specific Result	Chloride (mg/kg)
Depth below bottom of pit to groundwater	>100 feet	1,000

Confirmation Soil Sample Results

The analytical results for BTEX, TPH-GRO, TPH-DRO, and chloride for the two discrete confirmation soil samples collected in May 2012 are provided in Table 1 and summarized below:

- Benzene and BTEX were not detected above the laboratory reporting limits (LRLs) or above the SRALs of 10 and 50 mg/kg, respectively.
- TPH-GRO was not detected above LRLs. TPH-DRO was detected in both confirmation samples at concentrations ranging from 3,070 mg/kg (SKU 936 Pad #1) to 3,280 mg/kg (SKU 936 Pad #2).
- TPH (TPH-DRO and TPH-GRO) was detected at 3,070 mg/kg (SKU 936 Pad #1) and 3,280 mg/kg (SKU 936 Pad #2). TPH was not detected above the SRAL of 5,000 mg/kg in the two discrete confirmation samples that were collected.
- Chloride was detected in both confirmation samples collected, at 9,730 mg/kg (SKU 936 Pad #2) and 16,000 mg/kg (SKU 936 Pad #1). Chloride was detected above the NMAC closure criterion of 500 mg/kg in both soil samples collected.

The complete laboratory analytical results with chain of custody documentation are included in Attachment 5.

Chloride concentrations in confirmation soil samples SKU 936 Pad #1 and SKU 936 Pad #2 were above the regulatory criteria, which prompted additional site assessment activities.

Site Assessment Activities

In November 2013, ARCADIS conducted site assessment activities to characterize the lateral and vertical extents of soil impacts at the site. Soil boring locations were selected based on the results of confirmation soil sampling completed at the site in May 2012, locations of pipelines and other equipment at the site, and the extent of

the release as documented by Chevron MCBU personnel during the initial response activities. The site assessment activities and results are discussed below.

Pre-Field Activities

Prior to initiating field activities, ARCADIS updated the site-specific Health and Safety Plan in accordance with state and federal requirements. Prior to initiating drilling activities, underground utilities and other potential subsurface obstructions near the proposed boring locations were located and marked. A New Mexico One Call ticket was issued for the site, and a private third-party utility locator cleared all proposed boring locations for potential on- and off-site utilities that were not otherwise identified. Finally, ARCADIS staff conducted a visual inspection of the site to identify potential utility lines. Boring locations were flagged during the utility locate and coordinates were recorded using a Trimble® global positioning unit with differential capability.

Soil Sampling

To evaluate the potential extent of impacts to soil at the site, ARCADIS advanced four soil borings (SKU936-01, SKU936-02, SKU936-03, and SKU936-04) on November 4 and 5, 2013. Soil sampling locations are shown on Figure 2.

Prior to conducting drilling activities, each boring location was cleared for subsurface utilities with an air knife. The air knife could not be advanced more than 2 to 3 inches bgs due to the presence of a thick caliche layer. Each soil boring was then advanced to a total depth of approximately 25 feet bgs using air rotary drilling equipment.

Soil was continuously logged for stratigraphic characteristics. The soil samples were field screened for the presence of volatile organic compounds using a photo ionization detector (PID) in combination with visual and olfactory screening methods for evidence of petroleum hydrocarbons. The PID used during this investigation was calibrated daily with fresh air and isobutylene gas. Field personnel recorded PID readings, soil types, and other pertinent geologic data on the boring logs (Attachment 6). No staining or elevated PID readings were observed.

Lithologic data indicate that the subsurface material primarily consists of a sandy clay layer over a thick sandy caliche (soil carbonate) layer, with a clayey sand layer beneath to approximately 25 feet bgs (Attachment 6).

Soil Assessment Sampling

Six soil samples were collected from each of the four boring locations (for a total of 24 soil samples) beginning at a depth of 2 feet bgs (the approximate depth of the soil excavation in the initial release response activities) and continuing at 5-foot intervals from 5 to 25 feet bgs.

The assessment soil samples were retained in clean, laboratory-supplied glass jars, labeled, placed in an ice-chilled cooler, and submitted under appropriate chain of custody protocols to TestAmerica Laboratories.

Soil Assessment Sample Analysis

Soil samples collected from each boring were analyzed for the following constituents:

- BTEX by USEPA Method 8021B
- TPH-GRO by USEPA Method 8015B
- TPH-DRO by USEPA Method 8015B
- Chloride by USEPA Method 9056
- Percent moisture by ASTM International Method D2216

Boring Abandonment

Following sampling, the boreholes were filled with soil cuttings from the total depth to ground surface. The ground surface was restored to match the surrounding conditions.

Soil Assessment Comparison Criteria

ARCADIS evaluated soil assessment analytical results for benzene, total BTEX, and TPH by comparing the data with the NMOCD SRALs (NMOCD 1993), as presented in the Data Evaluation Approach section of this report.

To develop an appropriate site-specific soil screening level (SSL) for chloride for use at the site, ARCADIS performed simulations of unsaturated zone flow, transport, and saturated zone mixing of chloride using the MULTIMED model Version 2.0 (USEPA 1996). The NMAC chloride standard for domestic water supply of 250 milligrams per liter (NMAC 2001) was used to estimate a maximum allowable concentration of chloride in soil that would not leach to groundwater above the standard. The NMAC chloride standard is consistent with the National Secondary Drinking Water Standard for chloride, addressing taste and odor concerns (USEPA 2010).

Conservative site-specific input parameters were used in the MULTIMED (USEPA 1996) simulations compared to actual site and release conditions. Specifically:

- Modeled source lengths and areas modeled are generally significantly larger than the actual chloride-impacted soil areas.
- Chloride-impacted soil was modeled as having a uniform chloride concentration for the entire volume (i.e., area x depth) of specified soil.
- A reduction in chloride concentrations in subsurface soil due to soil chemical transformation or adsorption mechanisms was not included in the model calculations.

Based on the depth to groundwater and the aerial and vertical extents of each of the MULTIMED (USEPA 1996) simulations, with these conservative site-specific input parameters, modeled peak chloride concentrations will reach groundwater in approximately 540 to 860 years.

The Chloride MULTIMED Simulated Soil Screening Levels for the Protection of Groundwater memo is included as Attachment 7. The site-specific SSL was calculated using the input parameters presented in the table below.

Site-Specific Input Parameters	
Source length (m)	20
Source area (m ²)	400
Source depth (m)	0 to 1
Depth to groundwater (m)	20
Chloride SSL (mg/kg)	100,000¹

¹ A chloride SSL of 266,100 mg/kg was calculated using MULTIMED (USEPA 1996); however, a maximum allowable soil concentration of 100,000 mg/kg is recommended in accordance with the New Mexico Environment Department (NMED) risk assessment guidance (NMED 2012).

m = meter

m² = square meter

Soil Assessment Sample Results

The analytical results for BTEX, TPH-GRO, TPH-DRO, chloride, and moisture for the 24 soil assessment samples are provided in Table 1 and summarized below:

- Benzene and ethylbenzene were not detected above LRLs in any of the 24 soil samples collected.
- Of the 24 soil assessment samples collected, toluene (0.038 mg/kg) and total xylenes (0.081 mg/kg) were detected above the LRLs in only one soil sample collected at 2 feet bgs at SKU936-03.
- TPH-GRO was detected in all soil samples at concentrations ranging from 1.6 mg/kg (SKU936-03 at 20 feet bgs) to 3.4 mg/kg (SKU936-02 at 2 feet bgs).
- TPH-DRO (12 mg/kg) was detected above the LRLs in only one soil sample collected at 5 feet bgs at SKU936-02.
- Chloride was detected in all soil samples at concentrations ranging from 7.7 mg/kg (SKU936-03 at 10 feet bgs) to 390 mg/kg (SKU936-04 at 2 feet bgs). Chloride concentrations were not detected above the site-specific SSL of 100,000 mg/kg.

Laboratory analytical results with chain of custody documentation are provided in Attachment 5.

Summary and Conclusions

A release of produced water and oil occurred at the site on January 1, 2012, due to a polyethylene gas line release. Visually impacted soil was excavated to a depth of approximately 2 feet bgs and two discrete confirmation soil samples were collected from the base of the excavation in May 2012. Both confirmation soil samples had and chloride concentrations above regulatory criteria, which prompted an additional investigation. In November 2013, additional soil samples were collected to assess soil impacts within the observed aerial extent of the release. None of the soil samples collected during the 2013 assessment exceeded the NMOCD SRALs. In addition, chloride concentrations were reported below the site-specific SSL using the MULTIMED model (USEPA 1996).

Although not all chloride concentrations were reported below the NMAC closure criterion of 250 mg/kg (Table 1; NMAC 2009), all chloride concentrations in samples collected during the 2013 assessment were below the site-specific SSL (Attachment

7). Chloride impacts in shallow soil potentially associated with the release were delineated.

Potential migration of remaining petroleum hydrocarbons or chloride to groundwater is not expected due to the small size of the release, low precipitation (WRCC 2014a), and high evapotranspiration rates (WRCC 2014b), and the fine-grained nature of caliche layers present beneath the site. MULTIMED model results demonstrate that the remaining soil concentrations associated with the release do not pose significant risk to groundwater resources or other receptors.

Soil data presented in this report support a conclusion that impacted soil associated with the reported release at the site poses no significant threat to groundwater resources or other receptors. ARCADIS recommends that CEMC submit a request to the NMOCD that no further investigations or additional cleanup actions need to be performed at the site and that the NMOCD grant No Further Action status to the site.

If you have any questions or comments regarding the information presented in this report, please contact Jonathan Olsen at 713.953.4874 or Jonathan.Olsen@arcadis-us.com, or Kathleen Abbott at 925.296.7827 or Kathleen.Abbott@arcadis-us.com.

Sincerely,

ARCADIS U.S., Inc.

Attachment 1

Site Conceptual Model

The site is located in the western edge of the Permian Basin with Artesia (the closest town) located approximately 30 miles northwest of the site. Due to the arid climate, the site experiences low precipitation and high evapotranspiration rates. According to information obtained from the NMOSE online database, groundwater near the site is encountered at a depth of approximately 263 feet bgs.

A release of approximately 8.6 bbls of oil mixed with a small quantity of produced water occurred at the site on January 1, 2012 due to a release from a high-density polyethylene gas line. Chevron personnel from the Mid-Continent Business Unit (MCBU) stopped the release and recovered an unknown quantity of fluids using a vacuum truck. Chevron MCBU personnel excavated visually impacted soil in the area to a depth of approximately 2 feet bgs and collected two discrete confirmation soil samples from the base of the excavation on May 7, 2012. After collecting the soil sample, the excavated area was reportedly backfilled with imported soil. Analyte concentrations in one or more confirmation soil samples were above regulatory criteria, deeming additional site assessment activities necessary.

In November 2013, ARCADIS conducted site assessment activities to characterize the lateral and vertical extents of soil impacts at the site. Soil boring locations were selected based on the results of confirmation soil sampling completed at the site in May 2012, locations of pipelines and other equipment at the site, and the extent of the release as documented by Chevron MCBU personnel during the initial response activities. Analyte concentrations in samples collected during the 2013 assessment were reported below site-specific criteria. Site assessment activities demonstrate that remaining soil concentrations associated with the release do not pose significant risk to groundwater resources or other receptors.

By Whom?	David Pagano				
Was a Watercourse Reached?	☐ Yes ☒ No	If YES, Volume Impacting the Watercourse.			

If a Watercourse was Impacted, Describe Fully.*

Describe Cause of Problem and Remedial Action Taken.*

It appears someone drove around wellhead and snagged out poly gas line, causing 8.6bbl fluid spill, mostly oil with a small amount of produced water. Chemical rep notified pumper of spill to land at 10:45 and pumper immediately drove to well and shut well in to contain release. Well shut in at approx 11:00AM.

Describe Area Affected and Cleanup Action Taken.*

Approx 8.6bbls of fluid mostly oil spilled on pad and worked its way to the road as well as foot wide path that ran into the pasture. Vacuum truck vacuumed up standing liquid on pad and road. Chevron has received Archeological/wildlife clearance from BLM. Backhoe will excavate contaminated soil on pad and road and contaminated soil will be taken offsite for disposal. Spray off of pad into the pasture will be remediated by knocking off fluids from vegetation using biodegradable soap and then we are looking at using micro blaze to remediated contaminated soil. Surface sample will be taken tomorrow to determine level of chlorides in order to evaluate potential effectiveness of micro blaze for pasture/off pad remediation.

I hereby certify that the information given above is true and complete to the best of my knowledge and understand that pursuant to NMOCD rules and regulations all operators are required to report and/or file certain release notifications and perform corrective actions for releases which may endanger public health or the environment. The acceptance of a C-141 report by the NMOCD marked as "Final Report" does not relieve the operator of liability should their operations have failed to adequately investigate and remediate contamination that pose a threat to ground water, surface water, human health or the environment. In addition, NMOCD acceptance of a C-141 report does not relieve the operator of responsibility for compliance with any other federal, state, or local laws and/or regulations.

Describe Cause of Problem and Remedial Action Taken.*

It appears someone drove around wellhead and snagged out poly gas line, causing 8.6 bbls fluid spill, mostly oil with a small amount of produced water. Chemical rep notified pumper of spill to land at 10:45 and pumper immediately drove to well and shut well in to contain release. Well shut in at approximately 11:00 AM.

Describe Area Affected and Cleanup Action Taken.*

Approx. 8.6 bbls of fluid mostly oil spilled on pad and worked its way to the road as well as foot wide path that ran into the pasture. Vacuum truck vacuumed up standing liquid on pad and road. Chevron received Archeological/wildlife clearance from BLM. Backhoe excavated contaminated soil on pad and road and contaminated soil was taken offsite for disposal. Spray off of pad into the pasture was remediated by knocking off fluids from vegetation using biodegradable soap, and then used micro blaze to remediate contaminated soil.

Two discrete soil confirmation samples were collected from the base of the excavation before the excavated area was reportedly backfilled with imported soils. These sampling results indicated the presence of chloride concentrations in shallow soils at levels of regulatory concern.

In response to these results, an additional site assessment was conducted to confirm the extent of soil impacts.

Analytical results of the additional assessment are attached.

I hereby certify that the information given above is true and complete to the best of my knowledge and understand that pursuant to NMOCD rules and regulations all operators are required to report and/or file certain release notifications and perform corrective actions for releases which may endanger public health or the environment. The acceptance of a C-141 report by the NMOCD marked as "Final Report" does not relieve the operator of liability should their operations have failed to adequately investigate and remediate contamination that pose a threat to ground water, surface water, human health or the environment. In addition, NMOCD acceptance of a C-141 report does not relieve the operator of responsibility for compliance with any other federal, state, or local laws and/or regulations.

Comments

No additional comments.

Receipt

The samples were received on 11/7/2013 7:01 AM; the samples arrived in good condition, properly preserved and, where required, on ice. The temperatures of the 5 coolers at receipt time were 1.6° C, 1.7° C, 3.0° C, 3.0° C and 3.7° C.

GC/MS VOA

No analytical or quality issues were noted.

GC VOA

Method(s) 8021B: Surrogate recovery for the following sample(s) was outside the upper control limit: SKU936-03-25 (600-82260-29). This sample did not contain any target analytes; therefore, re-extraction and/or re-analysis was not performed.

No other analytical or quality issues were noted.

GC Semi VOA

Method(s) 8015B: Surrogate recovery for the following sample(s) was outside control limits: SKU936-02-05 (600-82260-41). Evidence of matrix interference is present; therefore, re-extraction and/or re-analysis was not performed.

No other analytical or quality issues were noted.

General Chemistry

Method(s) 9056: The matrix spike / matrix spike duplicate (MS/MSD) recoveries for batch 120752 were outside control limits for Chloride. The associated laboratory control sample (LCS) recovery met acceptance criteria.

Method(s) 9056: The matrix spike / matrix spike duplicate (MS/MSD) recoveries for batch 120842 were outside control limits for Chloride. The associated laboratory control sample (LCS) recovery met acceptance criteria.

Method(s) 9056: The matrix spike / matrix spike duplicate (MS/MSD) recoveries for batch 120842 were outside control limits for Chloride. The associated laboratory control sample (LCS) recovery met acceptance criteria.

No other analytical or quality issues were noted.

Organic Prep

No analytical or quality issues were noted.

Method Summary

Client: ARCADIS U.S., Inc.

Qualifiers

GC VOA

Qualifier	Qualifier Description
X	Surrogate is outside control limits

GC Semi VOA

Qualifier	Qualifier Description
X	Surrogate is outside control limits
*	LCS or LCSD exceeds the control limits

General Chemistry

Qualifier	Qualifier Description
F	MS/MSD Recovery and/or RPD exceeds the control limits

Glossary

Abbreviation	These commonly used abbreviations may or may not be present in this report.
□	Listed under the "D" column to designate that the result is reported on a dry weight basis
%R	Percent Recovery
CNF	Contains no Free Liquid
DER	Duplicate error ratio (normalized absolute difference)
Dil Fac	Dilution Factor
DL, RA, RE, IN	Indicates a Dilution, Re-analysis, Re-extraction, or additional Initial metals/anion analysis of the sample
DLC	Decision level concentration
MDA	Minimum detectable activity
EDL	Estimated Detection Limit
MDC	Minimum detectable concentration
MDL	Method Detection Limit
ML	Minimum Level (Dioxin)
NC	Not Calculated
ND	Not detected at the reporting limit (or MDL or EDL if shown)
PQL	Practical Quantitation Limit
QC	Quality Control
RER	Relative error ratio
RL	Reporting Limit or Requested Limit (Radiochemistry)
RPD	Relative Percent Difference, a measure of the relative difference between two points
TEF	Toxicity Equivalent Factor (Dioxin)
TEQ	Toxicity Equivalent Quotient (Dioxin)

Subject:
**Chloride Multimedia Exposure Assessment Model Simulated Soil Screening
Levels for the Protection of Groundwater**
HES Transfer Sites, Lea County, New Mexico

On behalf of Chevron Environmental Management Company, ARCADIS U.S., Inc. (ARCADIS) evaluated chloride remediation action levels for use at the Health Environmental Safety (HES) Transfer Sites near Hobbs, New Mexico. The New Mexico Oil Conservation District (NMOCD) has established soil screening levels (SSLs) for fluid management pits (also known as the "NMOCD PIT RULE" [NMAC 19.15.17]); however, no formal SSLs have been established by the NMOCD or the New Mexico Environmental Department (NMED) for surface releases of production water. The Risk Assessment Guidance for Investigation and Remediation (NMED 2012) states that SSLs should be based on risk to human health and the potential migration to groundwater with respect to the NMED-specific tap water SSL. Chloride is not considered hazardous and the NMED and the United States Environmental Protection Agency (USEPA) have not established tap water screening levels for chloride. However, the NMED has established a chloride standard for groundwater (NMAC 20.6.2.1101) of 250 milligrams per liter (mg/L). Therefore, the SSL for chloride should be based on the soil leaching to groundwater pathway.

To evaluate a chloride SSL for use at the HES Transfer Sites, ARCADIS performed simulations of unsaturated zone flow, transport, and saturated zone mixing of chloride using the Multimedia Exposure Assessment Model Version 2.0 (MULTIMED; USEPA 1996) to evaluate the potential migration of chloride in shallow soil through the unsaturated zone to the underlying groundwater. The initial simulations were intended to estimate a maximum allowable chloride soil concentration (site SSL) to evaluate HES Transfer

Sites in Lea County and eastern Eddy County, New Mexico, and to develop a baseline approach for using the model for potential future evaluations of solute migration at other HES Transfer Sites in New Mexico.

MULTIMED Overview

MULTIMED was originally designed to simulate the movement of solutes leaching from a landfill to various exposure pathways. Due to its general acceptance by the NMOCD and the USEPA and its ability to simulate unsaturated and saturated zone flow and transport, MULTIMED was selected for this evaluation. The model, as designed, simulates one-dimensional vertical transport in the unsaturated zone to the saturated zone based on user-provided input parameters considering vadose zone, saturated zone, and chemical-specific characteristic parameters.

The simulations were performed using both the unsaturated and saturated zone modules available in MULTIMED. The unsaturated zone module performs solutions of the downward flow of infiltrating water to the water table by Darcy's Law:

$$Q = -K_v \cdot K_{rw} \left(\frac{\delta\psi}{\delta z} \right)$$

Where:

ψ is the pressure head (meters [m])

z is the depth (m)

K_v is the saturated hydraulic conductivity (meters per year [m/year])

K_{rw} is the relative hydraulic conductivity

The boundary condition at the water table is:

$$\psi \cdot L = 0$$

Where:

L is the thickness of the unsaturated zone (m)

In the unsaturated zone, it is necessary to specify the relationship between relative hydraulic conductivity, pressure head, and water saturation. This relationship is given by van Genuchten (1976):

$$S_e = \theta_r + \frac{\theta_s - \theta_r}{[1 + (\alpha\psi^\beta)^\gamma]}$$

Where:

θ_r and θ_s are the residual water saturation and total water saturation (dimensionless), respectively

β, γ, α are empirical soil-specific parameters (dimensionless)

ψ is the air pressure entry head (m)

S_e is the effective saturation (fraction)

Source area concentrations are input as leachate concentrations, therefore, the soil/water partition equation was used to convert between total soil concentration in milligrams per kilogram (mg/kg) and the leachate concentration in mg/L:

$$C_t = \frac{C_l \cdot R \cdot \theta_w}{\rho_b}$$

Where:

C_t is the concentration of the chemical of interest in soil (mg/kg)

C_l is the concentration of the chemical of interest in leachate (mg/L)

R is the retardation coefficient (dimensionless, assumed 1 for chloride)

ρ_b is the bulk density of the soil (mg/L or grams per cubic centimeter)

The mass of the chemical of interest that reaches the groundwater is expressed by the simplified steady-state equation (Salhotra et al. 1995) that couples the vadose zone to the groundwater:

$$M_L = A_w \cdot Q_f \cdot C_l$$

Where:

M_L is the chemical of interest mass that leaches from site soil (grams per year [g/year])

A_w is the width of the source area (m²)

Q_f is the percolation rate from the facility/site (m/year)

The mixed groundwater concentration is controlled by the quasi-three-dimensional advection dispersion equations that are evaluated based on the following chemical concentration relationship within the mixing zone (Salhotra et al. 1995):

$$C(x, y, z, t) = \frac{H}{B} C_f(x, y, t) + \Delta C_p(x, y, z, t)$$

Where:

C is the dissolved concentration (mg/L, g/m³)

x, y, z are the spatial coordinates (m)

t is elapsed time (year)

H is the source zone penetration (m), with a maximum equal to B

B is the thickness of the saturated zone (m)

MULTIMED's output concentration is a centerline concentration based on a calculated dilution attenuation factor. Thus, the output concentration is the maximum concentration of the chemical of interest in groundwater at a reasonable distance downgradient from the source area.

Model Design, Inputs, and Assumptions

The required input parameters for the MULTIMED simulations are summarized in Table 1. Input parameters include model structure, unsaturated and saturated zones, and chemical characteristics. Minimal site-specific data regarding the HES sites are available; therefore, numerous input parameters are based on published reports, default NMED values (2012), default values provided in the modeling code, and ARCADIS's experience, as indicated in Table 1. The model values are considered representative of the Lea County, New Mexico area. Due to the intended use of the SSL at multiple sites, more conservative values were generally selected for the given ranges of input parameters.

The general assumptions used in the MULTIMED model design include:

- The unsaturated and saturated zones are a single, homogeneous material.
- The applied recharge and infiltration are constant throughout the simulation.
- Initial chloride concentrations in soil below the source area and in groundwater are equal to 0.
- The model assumes no chemical transformation or adsorption of chloride to soil materials.

The simulations were performed using the transient model capabilities of MULTIMED. Steady-state simulations were not chosen because MULTIMED requires the assumption that the source is continuous and constant throughout the simulation, which is not appropriate for these evaluations. Also, the transient model was selected to provide output that simulates the aquifer concentrations versus time and models a finite source.

Model Simulations and Results

Using the input parameters provided, soil concentrations for chloride were iteratively varied to arrive at an appropriate maximum allowable soil concentration that would be protective of groundwater for each of the scenarios. To calculate the maximum concentration that would be observed given the input concentrations and parameters, the simulation period selected was 1,980 years with 20-year time steps.

To ascertain the maximum allowable chloride concentration for more typical chloride concentration distribution and depth to groundwater scenarios, eight MULTIMED simulations were completed. The scenarios are summarized in Table 2. The input values for the simulations were the same, except for the thickness and width of the chloride-affected soil within the soil column. The first four simulations evaluated homogeneous chloride-affected soil 20 meters wide (400 square meters [m^2]) and varied the chloride-affected soil thickness between 1 meter and 3 meters and the depth to groundwater between 20 and 30.5 meters. The remaining four simulations evaluated homogeneous chloride-affected soil 45 meters wide (2,000 m^2) and varied the chloride affected soil thickness between 1 meter and 3 meters and the depth to groundwater between 20 and 30.5 meters

The predicted groundwater concentrations versus time are illustrated on Figures 1 through 8. The peak arrival times varied between 540 and 860 years. The simulations indicate the site SSLs for the protection of groundwater ranged from 8,525 to 266,100 mg/kg (Table 2) depending on the scenario and are protective of the New Mexico chloride groundwater standard of 250 mg/L.

The MULTIMED model, like any model, requires the use of simplifying assumptions regarding subsurface conditions and flow processes that result in inherent limitations and uncertainty compared to an actual flow system. In this case, uncertainty may be related to:

- The model assumes homogeneous unsaturated and saturated zones; the actual conditions at the sites likely contain numerous heterogeneities.
- The applied recharge and infiltration rates are constant. The aquifer hydraulic gradient is also assumed to be constant. These rates likely vary with time, and these variations may influence the solute migration and mixing, resulting in short-term changes in aquifer concentrations
- The model is a theoretical simulation of transport processes and is not verified or calibrated against site-specific data.

Conclusions and Recommendations

The model simulations reasonably represent conditions encountered at most of the Lea County and eastern Eddy County HES Transfer Sites. HES Transfer Sites with chloride-affected soil can be screened

against SSLs in Table 2, assuming they meet the specified conditions (source length, source depth, depth to groundwater, and soil concentration). For calculated SSLs greater than 100,000 mg/kg, a maximum allowable soil concentration of 100,000 mg/kg is recommended in accordance with the NMED risk assessment guidance (NMED 2012). For sites that meet all of these conditions, no further action is recommended. For the sites that do not meet these conditions, site-specific evaluations should be conducted.
