RE: DCP \* Buffalo Valley Compressor Station \* **2RP-3817**

Stephen,

At this time, OCD requests additional vertical delineation be performed at this site. At some point, a more definitive lateral delineation may be necessary, but before consideration of any remedial plan, a determination of the vertical extent of contamination is required. The three sample points that exhibited elevated hydrocarbon levels should be adequate for vertical definition (BH02, BH03, and BH06).

Please advise once you have this operation scheduled, or contact me if you have questions or concerns.

Thank you,

**Mike Bratcher**

Heather/Mike

Attached is the DCP Buffalo Valley Compressor Station Site Characterization Report for the completed field activities that were discussed in the Initial C-141 that was submitted back in August 2016. After you have had a chance to review the attached report and recommendations, I can either set up a conference call with DCP's environmental consultant or if possible meet at your office to discuss the Site Characterization Report along with our remedial approach. Just let me know which one you would prefer, if needed.

Thanks and don't hesitate to give me a call with any questions.
