Subject: Clayton Williams - Jenna Release

Mr. Bratcher

Next Thursday, we are scheduled to drill one auger boring at the Jenna site to a depth of 110 feet using a rathole rig. This boring is proposed adjacent to the sampling trench that shows the deepest penetration of high concentration chloride. We may wish to drill a second boring to a depth of 30 feet or so at another location of penetration – but we have not finished working up the data.

Please expect a map showing the results of the 6 trench samples and the proposed location(s) of deep borings in the next few days. I expect we will be done with the first boring before noon and the second boring soon thereafter.

I wanted to give you a head's up with sufficient time for you to plan an field trip if desired.
