testing has been completed. Final Abandonment Notices must be filed only after all requirements, including reclamation, have been completed and the operator has determined that the site is ready for final inspection.) Chevron well "Quahada Ridge 31-1" About five years ago the well was P&A'd. A liner was installed over the reserve plt, and it was capped over with caliche and on-site soil. The pad area occupying approximately 1.5 acre was windrowed and planted with BLM seed mix #4. Vegetative cover success has been poor in some places. To cure this deficiency, the following treatments will be applied over the entire 1.5-acre area: Prior to any invasive activities, a One Call utilities clearance will be conducted followed by a ground penetrating radar survey of the area. As requested by BLM, a diversion ditch will be excavated across the NW boundary of the site to drain water SE off the site. Vegetation will be scraped from between the windrows across the 1.5-acre site; and this removed vegetation will be stacked off-site for wildlife use. A 2-inch-thick layer of crushed gypsum (approximately 320 tons) will be applied to the surface between the windrows. The area between the windrows to a depth of approximately one foot (1') to incorporate the gypsum. At this point, clean topsoil will be the spread evenly between the windrows to a depth of approximately one foot (1') approximately 1,900 cu. yd. of clean topsoil will be required. Finally, a BLM-approved seed mix will be drilled into the newly-placed topsoil, and a nitrogen fertilizer will be applied.							
It is anticipated these reclamation efforts will achieve sustainable vegetative cover across the site.						RECEIVED
