FIREWEED 10 FEDERAL # 1 SWD API # 30-015-29165 PERMIT # SWD-1383

12/10/13 - Notified BLM (left message) that we were going to rig up WSU on 12/11/13, would be ready for BOPE test at 8:00 am.

12/11/13 - Rig up WSU, install BOPE called BLM to see if they were going to witness test. Spoke with Terry Wilson, he stated no one from BLM was going to witness test. Rig up Man Welding @ 9:00 am. Tested BOPE. All tests were good – Permian welding employee R.N Northcutt. (Chart attached) RD testers at 12:00 pm. Start drilling surface plug, fell through cement @ 60'. GIH with bit, 6 drill collars and tubing. Tag 2nd plug @ 473', start drilling cement, drill to 503'. SDFN.

12/12/13 - Continue drilling cement, fell through cement @ 698'. GIH with tubing, tag 3rd cement plug @ 2551'. Start drilling. SDFN

12/13/13 – Resume drilling, drilled to 2777'. SDFN

12/16/13 – Resume drilling cement, fell out of cement @ 2990'. GIH to tag 4th cement plug @ 5175'. Attempt to test csg, would not test. (Circulated up annulus of 7" casing) SDFN.

12/17/13 – COOH with tubing, drill collars and bit. GIH with RBP and packer to isolate holes in csg.

12/19 thru 12/23/13 – Identified holes in csg @ 15' from surface and 3603' – 3995'.

12/24/13 – GIH with cement retainer and tbg to 3600', squeezed 100 sxs cement into holes 3603' – 3995'. SD

12/26/13 - Pump 50 sxs cement into holes @ approximately 25'. Circulate cement to pit. (up 9 5/8' – 7" annulus). Left 1000 PSI on 7" csg. SD until 12/30/13.

12/30/13 – Drill cement @ surface. Fell through cement @ 45'. Test csg to 500 PSI, held good. GIH to drill cement retainer @3600'. SDFN

12/31/13 – Finished drilling cement retainer. Drill cement, fell through cement @ 3970', test csg to 500 PSI, held okay. No leak off. GIH tag 4th cement plug @ 5175'. SDFN.

01/02/14 – Drill cement from 5175' – 5415'. SDFN

01/03/14 – Drill cement from 5415' fell through @ 5445'. GIH to tag 5th cement plug @ 7393', pressure test csg to 500 PSI, held okay. Circulate heavy mud from well. Drill Cement to 7450'. SD.

01/06/14 – Drill cement from 7450', fell through cement @ 7682'. Circulate well clean. Test csg to 500 PSI, did not hold, COOH.

01/07/14 – 01/08/14 – GIH with RBP and packer to find leak. Identified holes in csg from 3740' to 4032'. Csg above and below leak was good, tested okay.

01/09/14 – Pump 240 sxs cement into leak 3740' – 4032', squeezed to 1500 PSI, shut in, left pressure on well. SD.

01/10/14 – Bled off pressure. GIH tag cement @ 3593'. Drilled to 3650'. SD, cement still green.

01/13/14 – Resume drilling cement, fell through cement @ 4008'. Test csg to 1000 PSI, held okay. Contacted Paul Swartz with BLM to witness test on 01/14/14 @ 8:00 am. SDFN

01/14/14 – Was told by Paul Swartz we had to test csg to 1500 PSI. Pressured up on csg to 1500 PSI, broke down squeeze, bled down to 950 PSI in 27 min. Chart attached. Discussed with Paul Swartz various ways to fix leak, also discussed, and was agreed, to allow us to finish drilling cement plugs and complete well so that we could evaluate well for disposal purposes. We also discussed only testing csg to 500 PSI for MIT test as we are going to leave the csg open to atmosphere while disposing water. GIH with bit, drill collars and tbg to finish drilling cement plugs. Tag cement @ 8369'. Drilled up cement, tag CIBP @ 8554'. SDFN

01/15/14 - Drilled CIBP @ 8554'. GIH tag plug @ 9204' (will be PBTD) SDFN.

01/16/14 - COOH with tbg, drill collars and bit. Prep to log and perforate on 01/17/14.

01/17/14 – RU Jarrel Serivices to run CBL (copy of log was emailed by Jarrel Services to BLM – Paul Swartz). Perforate well as follows: 7727'- 7769' (80 holes), 7828' – 7948' (96 holes), 8082' – 8160' (48 holes), 8425' – 8580' (60 holes), 8723' – 8900' (172 holes), 8909' – 9040' (188 holes), 9140' – 9190' (100 holes). 744 holes total. SDFN.

01/18/14 – GIH with packer and tbg. Set packer @ 7639'. Prep to acidize well on 01/20/14. SD. **01/20/14** – RU Elite Well Service with 20,000 gallons 20% HCL acid with corrosion and scale inhibitor. Average rate 7 BPM @ average PSI 3000#. Final shut in PSI 300#. Rig down acid trucks. SD.

01/21/14 - Flow back acid, SD.

01/22/14 - COOH with 2 7/8" work string, laid down on rack. SD.

01/23/14 – GIH with 3 ½" IPC (Salta) tbg. Pumped gelled packer fluid to attempt to seal leak in csg. Set packer @ 7636'. Pressure annulus to 500 PSI, had small leak off. Will monitor annulus to see if leak will seal off.

01/24/14 – 03/21/14 – Monitor csg, re-pressure weekly to attempt seal. 03/21/14 still had 80 PSI leak off @ 500 PSI in 30 minutes.

03/24/14 – Circulate gelled packer fluid from well. Pump 2% KCL H2O with packer fluid into annulus. Injected csg seal chemical into annulus. Pressured annulus to 550 PSI. Monitor to see if csg seals.

03/28/14 – On location with pump truck to check PSI. Richard Inge – OCD District 2 inspector came to location. Ran MIT test, pressured annulus to 560 PSI, 30 minutes 530 PSI. (Chart attached). Mr. Inge stated bleed off was within acceptable range. Attempted to contact BLM - Paul Swartz to discuss what we had done. Left voicemail.

03/31/14 – Again contacted BLM, spoke to Jim Hughes. Related actions that had occurred. He stated that Paul Swartz be contacted. Called Paul Swartz, left voicemail. Currently in process of constructing tank battery and disposal equipment. Will be ready to start disposal operations when pump and electricity are installed.

Company Raw 105+

Lease Fire wood 10 Fed # 15WD County Edd

Drilling Contractor Reliable Plug & Drill Pipe Size 2"Cup 12th Tabin

Accumulator Function Test - OO&GO#2

Date

To Check - USABLE FLUID IN THE NITROGEN BOTTLES (III.A.2.c.i., or ii or iii)

- Make sure all rams and annular are open and if applicable HCR is closed.
- Ensure accumulator is pumped up to working pressure! (Shut off all pumps)

1-Open HCR Valve. (If applicable)

2.-Close annular.

- 3. Close all pipe rams.
- 4. Open one set of the pipe rams to simulate closing the blind ram.
- 5. For 3 ram stacks, open the annular to achieve the 50+ % safety factor. (5M and greater systems).
- 6. Record remaining pressure <u>1100</u> psi. Test Fails if pressure is lower than required.
- **a** {950 psi for a 1500 psi system} **b**. {1200 psi for a 2000 & 3000 psi system }
- 7. If annular is closed, open it at this time and close HCR.

To Check - PRECHARGE ON BOTTLES OR SPHERICAL (III.A.2.d.)

Start with manifold pressure at, or above, maximum acceptable pre-charge pressure:
 a. {800 psi for a 1500 psi system}
 b. {1100 psi for 2000 and 3000 psi system}

- 1. Open bleed line to the tank, slowly. (gauge needle will drop at the lowest bottle pressure)
- 2. Close bleed line. Barely bump electric pump and see what pressure the needle jumps up to.
- 3. Record pressure drop <u>750</u> psi. Test fails if pressure drops below minimum.
- Minimum: a. {700 psi for a 1500 psi system } b. {900 psi for a 2000 & 3000 psi system}

To Check - THE CAPACITY OF THE ACCUMULATOR PUMPS (III.A.2.f.)

- Isolate the accumulator bottles or spherical from the pumps & manifold.
- Open the bleed off valve to the tank, {manifold psi should go to 0 psi} close bleed valve.
 - 1. Open-the HCR valve, {if applicable}
 - 2. Close annular Dige Roms.
 - 3. With **pumps** only, time how long it takes to regain the required manifold pressure.
 - 4. Record elapsed time 13<20. Test fails if it takes over 2 minutes.
 - **a**. {950 psi for a 1500 psi system} **b**. {1200 psi for a 2000 & 3000 psi system)
