Dat	e: 02/28/2018		GAS CA	PTURE PL	AN							
	☐ Original Operator & OGRID No.: Mewbourne Oil Company - 14744 ☐ Amended - Reason for Amendment:											
This Gas Capture Plan outlines actions to be taken by the Operator to reduce well/production facility flaring/venting for new completion (new drill, recomplete to new zone, re-frac) activity.												
Note: Form C-129 must be submitted and approved prior to exceeding 60 days allowed by Rule (Subsection A of 19.15.18.12 NMAC). Well(s)/Production Facility — Name of facility The well(s) that will be located at the production facility are shown in the table below.												
	Well Name	API		Footages	Expected MCF/D	Flared or Vented	Comments					
	Whitesnake 20/21 W2BC Fee #	30-015-43497	Sec 20, T23S, R28E	650 FNL & 220	OFWL 0		Online after frac					
	Whitesnake 20/21 W0BC Fee #	2H 30-015-44559	Sec 20, T23S, R28E	600 FNL & 220	FWL 0		Online after frac					
Gathering System and Pipeline Notification Well(s) will be connected to a production facility after flowback operations are complete, if gas transporter system is in place. The gas produced from production facility is dedicated toFrontier_Field_Services and will be connected toFrontier_Field_Services and will be connected to County, New Mexico. It will require ' of pipeline to connect the facility to low/high pressure gathering system. Mewbourne Oil Company provides (periodically) to _Frontier_Field_Services a drilling, completion and estimated first production date for wells that are scheduled to be drilled in the foreseeable future. In addition, Mewbourne Oil Company andFrontier_Field_Services have periodic conference calls to discuss changes to drilling and completion schedules. Gas from these wells will be processed atFrontier_Field_Services Processing Plant located in Sec21, Twn175 _, Rng32E _,Lea County, New Mexico. The actual flow of the gas will be based on compression operating parameters and gathering system pressures. Flowback Strategy												
After flar	er the fracture treatment ed or vented. During float, the wells will be turn	wback, the fled to product	uids and sand contion facilities. Ga	ntent will be a	nonitored. V d start as so	When the prod on as the wel	action tanks and gas will be luced fluids contain minimal ils start flowing through the					

Safety requirements during cleanout operations from the use of underbalanced air cleanout systems may necessitate that sand and non-pipeline quality gas be vented and/or flared rather than sold on a temporary basis.

Alternatives to Reduce Flaring

Below are alternatives considered from a conceptual standpoint to reduce the amount of gas flared.

is Operator's belief the system can take this gas upon completion of the well(s).

- Power Generation On lease
 - o Only a portion of gas is consumed operating the generator, remainder of gas will be flared
- Compressed Natural Gas On lease
 - o Gas flared would be minimal, but might be uneconomical to operate when gas volume declines
- NGL Removal On lease
 - o Plants are expensive, residue gas is still flared, and uneconomical to operate when gas volume declines
