Submit Original to Appropriate District Office

Oil Conservation Division 1220 South St. Francis Dr. Santa Fe, NM 87505

RECEIVED

Date: 4-15-18	GAS CAPTURE PLAN
☑ Original☐ Amended - Reason for Amendment	Operator & OGRID No.: <u>Mewbourne Oil Company - 14744</u>
This Gas Capture Plan outlines action new completion (new drill, recomplete	s to be taken by the Operator to reduce well/production facility flaring/venting fo to new zone, re-frac) activity.
Note: Form C-129 must be submitted and ap	oproved prior to exceeding 60 days allowed by Rule (Subsection A of 19.15.18.12 NMAC).
Well(s)/Production Facility - Name (of facility

The well(s) that will be located at the production facility are shown in the table below.

Well Name	API	Well Location (ULSTR)	Footages	Expected MCF/D	Flared or Vented	Comments

		_							

Well(s) will be connected to a production facility after flowback operations	are complete, if gas transporter system is in			
place. The gas produced from production facility is dedicated towester	and will be connected to			
Western low/high pressure gathering system located in EDDY	County, New Mexico. It will require			
3,400 of pipeline to connect the facility to low/high pressure gathering	system. Mewbourne Oil Company provides			
(periodically) to Western a drilling, completion and estimated first	production date for wells that are scheduled to			
be drilled in the foreseeable future. In addition, Mewbourne Oil Company	and Western have periodic			
conference calls to discuss changes to drilling and completion schedules.	Gas from these wells will be processed at			
Western Processing Plant located in Sec. 36, Blk. 58 T13	s,Culberson County, Texas. The actual flow			
of the gas will be based on compression operating parameters and gathering system pressures.				

Flowback Strategy

After the fracture treatment/completion operations, well(s) will be produced to temporary production tanks and gas will be flared or vented. During flowback, the fluids and sand content will be monitored. When the produced fluids contain minimal sand, the wells will be turned to production facilities. Gas sales should start as soon as the wells start flowing through the production facilities, unless there are operational issues on Western system at that time. Based on current information, it is Operator's belief the system can take this gas upon completion of the well(s).

Safety requirements during cleanout operations from the use of underbalanced air cleanout systems may necessitate that sand and non-pipeline quality gas be vented and/or flared rather than sold on a temporary basis.

Alternatives to Reduce Flaring

Below are alternatives considered from a conceptual standpoint to reduce the amount of gas flared.

- Power Generation On lease
 - Only a portion of gas is consumed operating the generator, remainder of gas will be flared
- Compressed Natural Gas On lease
 - o Gas flared would be minimal, but might be uneconomical to operate when gas volume declines
- NGL Removal On lease
 - o Plants are expensive, residue gas is still flared, and uneconomical to operate when gas volume declines
