The referenced well is currently SI. Devon proposes to TA this well for five years, with annual casing integrity tests. TA procedure would be as follows:

1. MIRU pulling unit. RIH with bit and scraper on tubing to 1600'. TOH.
2. RIH w/ packer on tubing to 1580'. Set packer, load backside and test casing. TOH w/ tubing.
3. If casing holds pressure, RIH with CIBP on tubing and set at 1580' (there is a collar at about 1590'). TOH w/ tubing, laying down. RDMO PU.
4. MIRU pump truck.
5. Tie onto casing. Load hole with lease water and test to 300 psi for 30 minutes. Record pressure on chart.
6. RDMO pump truck.

We request this TA status for the well as it is in our Atoka San Andres Unit waterflood. The well therefore has utility should additional intervals in the San Andres be perforated and flooded. As the ASAU is expected to produce for quite some time, the potential usefulness of this well will also be ongoing. As this situation is not expected to change, we are requesting a longer term temporary abandonment.
