DEPTH to GROUND WATER: >200'

General Site Characteristics: This drilling reserve pit is located west of Maljamar, NM off Sweet Gum Road. The terrain consist of sand dunes and gentle rolling hills with native grass, mesquite, and small yucca plants. Ground water depth is >200' based upon the Eddy County Depth to Groundwater Map. There are no known water wells or surface bodies of water within 1,000' of this location. The pit is approximately 100' x 75' x 3' and is located (center) 62' east from the well head.

Site ranking Score: 0 based upon above information

Soil Remediation Action Levels: Based upon NM OCD guidance

Sketch of Affected Area: See Attached

Work Plan Proposal: The proposed closure plan is to use the waste excavation and removal method. The pit contents, to include the liner, plus two feet of material below the liner will removed and transported to a division-approved facility for disposal. A five-point composite soil sample will be obtained and analyzed for Benzene, BTEX, TPH, GRO/DRO, and chlorides. If there is evidence of a release, a form C-141 with supporting documentation will be submitted detailing the remediation work that will continue.

Soil Cover Designs: Once the area has been remediated to NM OCD's satisfaction, the excavated area will be back filled using clean soil from a near-by pit. Topsoil will be used to cover the backfill. The area will be contoured to match the surrounding terrain.

Re-vegetation: The area will be seeded using a BLM approved seed mixture and technique.
