- treating company. Phillips supervisor will hold safety meeting with treating company personnel. RU to acidize the San Andres open hole interval with 2,500 gallons of 15% NEFE HCl containing clay stabilizer. Load annulus with produced water and monitor level in annulus during treatment. Pressure test all lines to 5,000 psi before starting treatment. Keep treating pressure as low as possible, maximum treating pressure 5,000 psi. Treat at 4-5 BPM as follows:
  - a. Open circulating valve and displace tubing with 450 gallons of acid. Close circulating valve.
  - b. Pump 1,050 gallons acid.
  - c. Pump 250 gallons 10 ppg brine containing 1.5 lb/gal graded rock salt.
  - d. Pump 1,000 gallons acid.
  - e. Flush with 22 bbls of 2% KCl water.
- 7. Flow and swab back acid and load water (total volume is 87 bbls).
- 8. COOH with tubing and packer.
- 9. GIH with packer-type RBP and RTTS-type packer on tubing. Set RBP at  $\pm 2,920$ '. Set packer at  $\pm 2,910$ ' and test RBP to 1,000 psi. Release packer.
- 10. Spot 18 bbls of 10% acetic acid from 2,880' to 2,430'. COOH with tubing and packer.
- ll. MI wireline company. Phillips supervisor will hold safety meeting with wireline company personnel. Run Gamma Ray/Collar Locator log from TD 3,126' to 2,200'. RU to perforate 7" casing using 4" OD casing gun loaded with deep penetrating DML charges, 2 shots/ft, spiral shot phasing. Perforate as follows top to bottom:

```
2 feet
2,435' - 2,437'
                            4 shots
2,538' - 2,542'
                  4 feet
                             8 shots
                            4 shots
8 shots
8 shots
2,650' - 2,652'
                  2 feet
2,716' - 2,720'
                  4 feet
2,732' - 2,736'
                  4 feet
2,834' - 2,836'
                  2 feet
                             4 shots
2,869' - 2,871'
                  2 feet
                             4 shots
                  20 feet
TOTAL
                             40 shots
```

Note: Casing collars are located at 2,425', 2,457', 2,489', 2,522', 2,554', 2,584', 2,616', 2,647', 2,679', 2,711', 2,743', 2,775', 2,807', and 2,840' from Dresser Atlas PFC Log run 9/21/81.

- 12. GIH with 7" RTTS-type packer on 2-3/8" work string. Set packer at  $\pm 2,375$ '. RU and swab well to clean up perforations.
- 13. RU treating company to acidize Grayburg perforations with 5,400 gallons of 7-1/2% NEFE HCl. Load annulus with produced water and hold 500 psi on annulus while treating. Pressure test all lines to 5,000 psi before starting treatment. Keep treating pressure as low as possible, maximum treating pressure 5,000 psi. Treat at 4-5 BPM as follows:
  - a. Open circulating valve and displace tubing with 350 gallons of acid. Close circulating valve.
  - b. Pump 5,050 gallons of acid containing one (1) 1.1 s.g. ball sealer in each 50 gallons acid (101 balls total).
  - c. Flush with 30 bbls of 2% KCl water.

Note: 7-1/2% acid must contain clay stabilizer and fines suspension agent.

- 14. Flow and swab back acid and load water (total load volume 158 bbls).
- 15. Unseat packer, GIH and release RBP. COOH with tubing, packer, and bridge plug.
- Notify N.M.O.C.D. (Mike Williams, (505) 748-1283,

  Artesia, New Mexico) 24 hours prior to performing this step. GIH with 7" Baker Model AD-1 (or equivalent) plastic coated injection packer on plastic coated 2-3/8", 4.7#/ft, J-55 8rd EUE tubing. Displace tubing-casing annulus with 2% KCl water containing 1% by volume of Techni-hib 370 (packer fluid). Set packer at ±2,375' in 10,000 lbs tension. Pressure test casing to 500 psi for 15 minutes; use two-pen recorder to record tubing and casing pressure during test.

Note: Packer should have shear ring installed to allow the packer to be released by shearing with  $\pm 25,000$  lbs tension.

17. Remove BOP, install wellhead injection assembly, and place well on injection. Do not exceed 485 psi surface injection pressure.
