NORTHWEST NEW MEXICO PACKER LEAKAGE TEST INSTRUCTIONS

- A peoker wekage test whell be commenced on each multiply complated well within seven days effer echial completion of the well, and annually thereafter as prescribed by the order authorizing the inultiple completion. Such tests shell also be commenced on all multiple completions within seven days following recompletion end/or chemical or fracture treatment, and whenever remedial work has been done on a well during which the packer or the futing have been distribed. Tests shall also be taken at any time that communication is suspended or when requested by the Division.
- 2. At least 72 hours prior to the commencement of any packer leakage test, the operator shall notify the Division in writing of the exact time the test is to be commercial. Offset operators shall also be notified.
- 3. The packer leakage test shall commence when both zones of the dual completion are shuffen for pressure stepilization. Both zones shall remain shuffen until the well-head pressure in each has stabilized, provided however, that they need not remain shuffen never days.
- For Flow Test No. 1, one izone of the dual completion shall be produced at the normal rate of production while the other zone remains shut-in. Buch test shall be continued for saverildays in the case of a gas well and for 24 hours in the case of an oil well. Note, if, on an inxial backer, leakage test, at gas well is being flowed to the atmosphere due to the lack of a populae correction the flow period shall be three hours.
- 5 Fallowing compresion of Firm Teet No. 1, the well shall again be shut-in in accordance with Paragraph 3 above.
- Flow Test No. 2 shall be conducted even though no leak. Was indicated during Flow Test No. 1 Procedure for Flow Test No. 2 is to be the same as for Flow Test No. 1 except.

- that the previously produced izone shall remain shut-in while the zone which was previously shut-in is produced
- 7. Pressures for gas-zone texts must be measured on each zone with a dead-weight pressure garge at time intervals as follows: 3 hours tests: Immediately prior to the degraning of each flow-period, at fifteen-minute intervals during the first hour theraof, and at hourly intervals thereafter, including one pressure measurement immediately prior to the conclusion of each flow period. 7-day tests: immediately prior to the beginning of each flow period, at least one time during each flow period (at approximately the midway point), and immediately prior to the conclusion of each flow period. Other pressures may be taken as desired, or may be requested on wells which have previously shown questionable test data.

24 hour oil zone tests all pressures, throughout the entire test whell be continuously measured and recorded with recording pressure gauges the accuracy of which must be checked at least twice, once at the beginning and once at the end of of each test, with a deadweight pressure gauge off a walk is a gas-oil or an off-gas dual completion, the recording gauge shalf be required on the oil zone only, with deadweight pressures se required above being taken on the gas zone.

8 The results of the above described tests shall be filed in unbloate within 16 days after completion of the test. Tests shall be filed with the Aztec Outriol Office of the New Mexico Office control New Mexico Packer Leavege Test. Form Revised 10-01-98 with all deadwelght pressures indicated thereon as well as the flowing temperatures (give sones only) and growly and GCR (or rones only).
