Job: Clean out, N_2 Acidize

Procedure:

This procedure is meant to be followed. It is up to the WSM, Remedial Engineer and Production Engineer to make the decisions necessary to do SAFELY what is best for the well. In the extent that this procedure does not reflect actual operations, please contact RE, PE and Superintendent for possible MOC.

1. Ensure location is in appropriate conditions, anchors have been tested within the last 24 months, power line distance has been verified to determine if variance is needed and the right tools are scheduled for the energized job.

2. Verify that well does not have pressure or flow. If well has pressure, note tubing and casing pressures on Wellview report. Bleed down well; if necessary, kill with cut brine fluid (8.6 ppg) *Well has low bottom hole pressure so try to minimize amount of fluid pumped into well.*

   - **Caliper elevators and tubular EACH DAY prior to handling tubing/tools. Note in JSA when and what items are callipered within the task step that includes that work.**

3. MI & RU workover unit.

4. Unseat pump, POOH with rods and pump. Examine rods for wear/pitting/paraffin and capture any samples for analysis. Do not hot water unless necessary. ND wellhead, unset TAC, NU BOP. POOH and LD 1 jt, PU 5.5" packer and set ~ @ 25', test BOP pipe rams to 250 psi/500 psi. Note testing pressures on WellView report. Release and LD packer.

5. POOH while scanning 2-7/8" prod tubing (TAC 3,586', EOT 4,020', PBTD 4,202). LD TAC and 2-7/8" tbg, remove all non-yellow band tbg.

   Note: Strap pipe out of the hole to verify depths and note them on Wellview report.
   Send scan log report to lgbi@chevron.com .

   - **Caliper elevators and tubular EACH DAY prior to handling tubing/tools. Note in JSA when and what items are callipered within the task step that includes that work.**

6. PU and RIH 4-3/4" MT bit, 3-1/2" drill collars on 2-7/8" L-80 WS hydrotesting to 6000 psi to match maximum pressure. Tag and record fill depth. RU power swivel and clean out to 4,150'. POOH with 2-7/8" WS and bit. LD bit & BHA.

   Note: If circulation is not expected, notify Remedial Engineer to discuss CO with bailer (continue to step 7) or foam/air unit (continue to supplemental procedure on back).

7. PU and RIH with 4-3/4" MT and Bulldog bailer on 2-7/8" 6.5# L-80 WS. Tag and record fill depth. Clean out to 4,150'. POOH and LD bit & BHA.

   - **Expect trapped pressure inside tubing while breaking connections during bailing operations, discuss on JSA and mitigate hazard. Use mudbucket (remove bottom seals if applicable) while breaking connections.**

8. POOH. LD bit & BHA.

9. PU and RIH with 5-1/2" treating packer on 2-7/8" 6.5# L-80 WS. Set packer ~ 3,650'. Load and test backside to 500 psi.

10. Prep location for N2 Acid Treatment. RU 2 open tanks (equipped with gas buster) and set them on opposite sides of the prevailing wind on location if possible. This is to ensure the flow is directed downwind at all times. Steel lines are to be secured with safety restraints as shown on **Image A**. If Service Company lacks safety restrains contact Guardian for rental. NU TIW valve rated for 10,000 psi **(newly-tested and functioned).** Have flowback crew and choke manifold ready for flowback stage. Ensure all flowback equipment has current inspection and is properly secure.

11. Pressure up and maintain 300 psi on backside throughout acid job, monitor it and bleed down as necessary. If leak is detected go to flush and take necessary steps to correct.

12. MI & RU Service Company (Schlumberger, Halliburton or Baker). **Test lines to 6,000 psi**. Treat perfs from 3,672' to 3,916' per schedule on Table A.

    Maximum treating pressure at surface is 5,000 psi. Set pop-off to less than 5,000 psi.

13. Pump 3 bbls of Brine water ahead @ 2 BPM. **Set maximum rate @ 5 BPM.**

    Acidize following Table A below

    Note: Please refer to the attached N2 Acid Job Procedure for full details.

Table A. Treatment Schedule (Schlumberger example)

PUMPING SCHEDULE

STAGE 1

Step Name	Pump Rate bbl/min	Fluid Name	Step volume gal	Proppant	Prop. Conc. PPA
Circulate	5 0	Brine (2% KCl)	100		0 0
Acid	5 0	15% HCl (50% Q N2)	800		0 0
Acid	5.0	15% HCl (75% Q N2)	1,900		0.0
Acid	5 0	15% HCl (50% Q N2)	800		0.0
Acid	5 0	15% HCl (75% Q N2)	1,800		0.0
Acid	5 0	15% HCl (50% Q N2)	800		0 0
Acid	5 0	15% HCl (75% Q N2)	1,900		0.0
Acid	5 0	15% HCl (50% Q N2)	800		0.0
Spacer	5 0	Brine (2% KCl)	200		0.0

Stage Descriptions / Flush Volumes

Stage Description	Fluid Name	Fluid volume gal	Stage Time min
Stage 1 (Perf MD = 3650.00 - 3900 00 ft)	Nitrogen Flush	924	4 4

Fluid Totals	
15% HCl (50% Q N2)	3,200 gal
15% HCl (75% Q N2)	5,600 gal
Brine (2% KCl)	300 gal

Proppant Totals

****If other service company is used refer to their attached pump schedule*

Pump a total of 8,800 gals (209 barrels) of anti-sludge **15% HCl foamed acid*** per attached procedure.

14. Displace acid to bottom perf (3,916') with 100% Nitrogen as indicated on last stage.

15. RDMO. Shut in well for 4 hrs for the acid to spend. Monitor casing pressure to keep it below 300 psi. Bleed off excess pressure if necessary.

    Note: Acid job MUST start in the morning. If acid job is deferred, contact Remedial Engineering to discuss postponing job until the following day.

16. Flow well back to open tank. **If necessary, discuss flowing the well 24 hours a day as long as all the safety precautions are in place. Ensure light towers and a 2-man flowback crew are in place.**

17. Flowback well dead (may take 1 or 2 days), **Notify Derek Nash @ 432-687-7506 before pumping any kill fluid.**

    - **Ensure all personnel on location are aware of N2/H2S release and proper hazard mitigation and discussion is in place. Gas is to be vented downwind to either open tank at all times during flowback.**

    - **Consider a safety trailer and 4-way monitor system to monitor well flowback.**

18. Release packer, POOH and LD packer.

19. PU and RIH with 4-3/4" MT bit on 2-7/8" L-80 WS tag for fill. If fill entry was indentified @ 4,150' or above, clean-out to (4,150').

20. POOH & LD 2-7/8" WS and BHA.

21. RIH with 2-7/8" production tubing hydrotesting to 5,000 psi. **Set TAC per ALCR recommendation and record it on WellView.**

22. ND BOP. NU WH. **RIH with rods and pump per ALCR and record how much the pump was spaced-out on WellView.** Hang well on.

23. RD and release workover unit. Turn well over to production (contacts on back). Clean location.

FOAM / AIR CLEANOUT PROCEDURE

- This procedure is an addition to the original procedure.

1. Install flowback manifold with two chokes. All components on flowback manifold must be rated to at least 5,000 psi. If possible, flowback manifold components should be hydrotested before delivery. Hardline pipes from 2" casing valve to manifold to half pit with gas buster.
2. Install flowback tank downwind from rig.
3. Position Air unit upwind from Rig next to water tanks. Have vacuum truck on standby to empty halfpit. (if needed)
4. RIH w/ 4-3/4" MT bit, bit sub (with dart-type float), 4 (3-1/2") drill collars on 2-7/8" 6.5# L-80 WS.
5. NU stripper head with **NO Outlets** (Check stripper cap for thread type - course threads preferred). **Stripper head to be stump tested to 1,000 psi before being delivered to rig**. Check chart or test at rig.
6. RU foam air unit. Make quality foam on surface before going down hole with foam/air. Install flapper float at surface before beginning to pump. Break circulation with foam/air. Evacuate fluid from well.

Pump high quality foam at all times. Do not pump dry air at any time. Fluid injection rates will generally be above 12 gallons per minute

Whenever there is pressure on the stripper head, have a dedicated person continuously monitor pressure at choke manifold and have a dedicated person at accumulator ready to close annular BOP in case stripper leaks. Do not allow pressure on stripper head to exceed 500 psi. If pressure cannot be controlled below 500 psi, stop pumping, close BOP and bleed off pressure.

7. Clean out fill to 4,150 with low RPM's rotation and circulation, always keep pipe moving. Short trips can be beneficial to hole cleaning. Circulate well clean for at least 1 hour at the end of the day.
8. When tripping out of hole, have special float bleed off tool available to relieve trapped pressure below float.

Ensure that high quality, stiff foam is pumped while circulating the fill. Stiff foam is required to prevent segregation while circulating. Monitor flow and pressures carefully when cleaning out.

Before rigging up power swivel to rotate, carefully inspect Kelly hose to ensure that it is in good condition. Ensure that swivel packing is in good condition.

Continue to step 8.
