Surface Casing to 1,140'
OTHER:

13. Describe proposed or completed operations. (Clearly state all pertinent details, and give pertinent dates, including estimated date of starting any proposed work). SEE RULE 19.15.7.14 NMAC. For Multiple Completions: Attach wellbore diagram of proposed completion or recompletion.

The Targa Monument AGI D #2 well was spudded at 10:05 am on Wednesday, November 23, 2016. The well was completed to a depth of 1,040.1 feet total vertical depth (TVD) in the top of the Rustler at 03:30 am, 11/24/2016. This interval provides a solid and stable casing seat that is above the underlying Salado Formation (salt). The surface casing is 13 3/8-inch 48# H-40 STC casing installed in a 17 1/2-inch borehole. Attachment A is the complete well schematic as designed. Attachment B is the 'as built' casing tally for the Targa Monument AGI D #2 surface casing.

A fluid caliper log was completed on the Targa Monument AGI D #2 surface casing borehole on Thursday, November 24, 2016. The result for the 17 1/2 inch borehole was an average borehole diameter of 19.45-inches. Attachment C is the summary report from Davis Fluid Calipers, Inc.

Halliburton provided the services for the Targa Monument AGI D #2 surface casing cement job. The compressive strength test results were onsite before the cement job and Geolex reviewed the report prior to the cementing of the surface casing. on Thursday, November 24, 2016. The results were that at least 13.5 hours wait on cement were required to reach 500 psi compressive strength. Attachment D is the Halliburton cement compressive strength lab report.

Cementing of the surface casing occurred on Thursday, November 24, 2016. NMOCD was notified but did not elect to be onsite to witness. The surface casing was cemented with one stage of class C cement. The lead was 595 sacks of ExtendaCemTM - CA cement with a yield of 1.663 ft³ per sack. The tail was 335 sacks of HalCemTM C with a yield of 1.364 ft³ per sack. 294 sacks of cement were returned to the surface. The cement did fall back approximately 50 feet and was topped off with approximately 18 sacks of QuickCrete manually mixed onsite. Wait on cement (WOC) was more than 14 hours. The Halliburton cement report is included as Attachment E.

A cement bond log (CBL) was completed by Renegade Services. The logging results indicated that there is adequate hydraulic isolation in the surface casing annulus and NMOCD approved the cement job based on 294 sacks of cement returned to the surface. Attachment F is a photo of the cement returns in the half-round tank and Attachment G is the CBL for the Targa Monument AGI D #2 surface casing.

A casing integrity test (CIT) was conducted on Saturday, November 26, 2016. The casing was successfully tested to 500 psi for a period of 30 minutes. Attachment H includes the CIT chart showing the test results along with the field report.

I hereby certify that the information above is true and complete to the best of my knowledge and belief.
