---	---

13. Describe proposed or completed operations.

The MIT and Braden head test were conducted on Thursday, August 9 at 9:38 am.

1. Initially the starting injection pressure and the annular space pressure between casing and tubing was 308 psig.
2. Place chart on annular space and began recording annular space pressure.
3. Bled off annular fluid (diesel) to bring observed annular space pressure to zero psig.
4. Slowly raised annular pressure by introducing diesel to the annulus to bring pressure to 600 psig.
5. When annulus pressure reached 600 psig closed valves to pumping truck and recorded annular space pressure for 32 minutes
6. The Frontier Maljamar AGI #1 was injecting TAG at 2278 psig and 106.5° F.
7. After 32 minutes bled off annular fluid to reduce observed pressure to zero psig.
8. Stopped recording TEST COMPLETE.
9. Restored annular pressure to normal.

The Braden head test was conducted concurrent with the MIT, which included bleeding off the pressure and monitoring pressure while keeping the valves open during the MIT test.
