Zia AGI#1 MAOP 2233 psig NMOCC Order R-13809 / Zia AGI D#2 MAOP 5208psig NMOCC Order R-14207

Quarterly Report for the period from July 1 through September 30, 2018 Pursuant to NMOCC Orders 13809 and 14207 for Zia AGI #1 and AGI D#2, respectively.

This report includes the data and analysis of surface injection pressure, TAG temperature, casing annular pressure as well as downhole injection pressure, temperature and annular pressure for the Zia AGI#1 and for the Zia AGI D#2 for Q3 2018. AGI D#2 is the primary well for this facility with the Zia AGI#1 to be used only as a redundant and backup well. Based on data for surface injection/annular pressure and their current MITs both wells continue to show excellent integrity. For the third quarter 2018, the values for injection parameters are generally stable and yielded the following results which are graphed in detail in attached Figures 1 through 10. All of the values presented below are averages for the static conditions in the AGI #1 since the well was not in operation for the entire reporting period. Only AGI D#2 was operated during this quarter and its average values represent the normal operational condition of the well.

AGI#1 Surface Measurements (inactive): Average TAG Line Pressure: 9 psig, Average Annular Pressure: 111 psig, Average Pressure Differential: -103 psig, Average Tag Line Temperature: 81°F, Average TAG injection rate: 0.00 MMSCFD (not in use this quarter).
AGI#1 Downhole Measurements (inactive): Average bottom hole pressure 3,305 psig, Average annular bottom hole pressure: 2,280 psig, Average bottom hole TAG Temperature: 98°F.
AGI D#2 Surface Measurements: Average TAG Injection Pressure: 1,512 psig, Average Annular Pressure: 548 psig, Average Pressure Differential: 964 psig, Average Tag Temperature: 106°F, Average TAG injection rate: 5.16 MMSCFD.
AGI D#2 Downhole Measurements: Average bottom hole pressure 6,137 psig, Average bottom hole TAG Temperature: 165°F. Only AGI D#2 was operated during this reporting period.

The data gathered throughout the third quarter of 2018 demonstrate the correlative behavior of the annular pressure with the flowrate, injection pressure and temperature and also show the sensitive and correlative response of the annular pressure confirming that both wells have good integrity and are functioning appropriately within the requirements of their respective NMOCC orders. No mechanical

changes to the either well or wellhead have been made since the last quarterly report. Well AGI D#2 displays excellent reservoir characteristics easily accommodating the required volumes of TAG from the facility. This well will be used as the primary disposal well for the facility with the AGI #1 well being operated as needed to confirm functionality and to allow for any required future maintenance on the AGI D#2 well.

I hereby certify that the information above is true and complete to the best of my knowledge and belief.
