GAS CAPTURE PLAN

☒ Original
☐ Amended
Reason for Amendment:

Operator & OGRID No.: 217817
Date: 12-03-2018

This Gas Capture Plan outlines actions to be taken by the Operator to reduce well/production facility flaring/venting for new completion (new drill, recomplete to new zone, re-frac) activity.

Note: A C-129 must be submitted and approved prior to exceeding 60 days allowed by Rule 19.15.18.12.A

Well(s)/Production Facility – Name of facility

The well(s) that will be located at the production facility are shown in the table below.

	Well Name	API	Well Location (ULSTR)	Footages	Expected MCF/D	Flared or Vented	Comments
✓	SEMU 125	30-025-34126	M, Sec 18, T20S, R38E	10 FSL& 190 FWL		0	footage of pipeline 3690'
	SEMU 126	30-025-34127	M, Sec 19, T20S, R38E	1310 FSL & 1120 FWL		0	footage of pipeline 2112'

Gathering System and Pipeline Notification

Well(s) will be connected to a production facility after flowback operations are complete, if gas transporter system is in place. The gas produced from production facility is dedicated to Targa and will be connected to Gas Targa low/high pressure gathering system located in Lea County, New Mexico. It will require 3690' of pipeline to connect the facility to low/high pressure gathering system. ConocoPhillips Company provides once brought on line to GasTransporter a drilling,completion and estimated first production date for wells that are scheduled to be drilled in the foreseeable future. In addition,Operator and Gas Transporter have periodic conference calls to discuss changes to drilling and completion schedules. Gas fromthese wells will be processed at Targa Processing Plant located in Sec.18, TWN 20S, RNG 38E ,Lea County,New Mexico. The actual flow of the gas will be based on compression operating parameters and gathering system pressures.

Flowback Strategy

After the fracture treatment/completion operations, well(s) will be produced to temporary production tanks and gas will be flared or vented. During flowback, the fluids and sand content will be monitored. When the produced fluids contain minimal sand, the wells will be turned to production facilities. Gas sales should start as soon as the wells start flowing through the Targo production facilities, unless there are operational issues on Gas Transporter system at that time. Based on current information, itis Operator's belief the system can take this gas upon completion of the well(s).

Safety requirements during cleanout operations from the use of underbalanced air cleanout systems may necessitate that sand and non-pipeline quality gas be vented and/or flared rather than sold on a temporary basis.

Alternatives to Reduce Flaring

Below are alternatives considered from a conceptual standpoint to reduce the amount of gas flared.

- Power Generation – On lease
  - Only a portion of gas is consumed operating the generator, remainder of gas will be flared
- Compressed Natural Gas – On lease
  - Gas flared would be minimal, but might be uneconomical to operate when gas volume declines
- NGL Removal – On lease
  - Plants are expensive, residue gas is still flared, and uneconomical to operate when gas volume declines
