**GAS CAPTURE PLAN**

Date:  
08/02/2017

RECEIVED  
MAR 08 2019

Original  
 Amended - Reason for Amendment: \_\_\_\_\_

Operator & OGRID No.: ConocoPhillips Company, 217817

This Gas Capture Plan outlines actions to be taken by the Operator to reduce well/production facility flaring/venting for new completion (new drill, recomple to new zone, re-frac) activity.

**HOBBS OCD**

Note: Form C-129 must be submitted and approved prior to exceeding 60 days allowed by Rule (Subsection A of 19.15.18.12 NMAC).

MAR 08 2019

**Well(s)/Production Facility – Name of facility**

**RECEIVED**

The well(s) that will be located at the production facility are shown in the table below.

Well Name	API	Well Location (ULSTR)	Footages	Expected MCF/D	Flared or Vented	Comments
Zia Hill 20 Federal COM 101H, 102H, 103H, 104H, 105H, 106H, 107H, 108H	Pending 30-225-95711	Sect. 20, 26S, 32E	various		0	flaring is expected to be sporadic

Note: Completion dates will vary, but typically will occur 30-90 days after total depth (TD) is reached.

**Gathering System and Pipeline Notification**

Well(s) will be connected to a production facility after flowback operations are complete, if gas transporter system is in place. The gas produced from production facility is dedicated to Enterprise Products and will be connected to Red Hills Trunk Line low/high pressure gathering system located in Eddy County, New Mexico. It will require 2183' of pipeline to connect the facility to low/high pressure gathering system. ConocoPhillips Company provides (periodically) to Enterprise Products a drilling, completion and estimated first production date for wells that are scheduled to be drilled in the foreseeable future. In addition, ConocoPhillips Company and Enterprise Products have periodic conference calls to discuss changes to drilling and completion schedules. Gas from these wells will be processed Ramsey Processing Plant located in Eddy County, NM. The actual flow of the gas will be based on compression operating parameters and gathering system pressures.

**Flowback Strategy**

After the fracture treatment/completion operations, well(s) will be produced to temporary production tanks and gas will be flared or vented. During flowback, the fluids and sand content will be monitored. When the produced fluids contain minimal sand, the wells will be turned to production facilities. Gas sales should start as soon as the wells start flowing through the production facilities, unless there are operational issues on Enterprise Products system at that time. Based on current information, it is ConocoPhillips's belief the system can take this gas upon completion of the well(s).

Safety requirements during cleanout operations from the use of underbalanced air cleanout systems may necessitate that sand and non-pipeline quality gas be vented and/or flared rather than sold on a temporary basis.

**Alternatives to Reduce Flaring**

Below are alternatives considered from a conceptual standpoint to reduce the amount of gas flared.

- Power Generation – On lease
  - Only a portion of gas is consumed operating the generator, remainder of gas will be flared
