MCA #393

We propose to revise the casing and cementing program for the 5-1/2", 17#, J-55, LTC production casing to allow us to cement this casing string using a Stage Cementing Tool and an External Casing Packer. The reason for this proposal is because we encountered a water flow of approximately 25 bbls per hour at approximately 3600'.

The proposed procedure is:

- 1. Run an External Casing Packer with an 8 foot handling sub above it and a Stage Cementing Tool made up to the handling sub above the External Casing Packer. This would be run in the 5-1/2" production casing string and positioned at approximately 3000' to 3100'.
- 2. Pump the first stage cement, 16.4 ppg slurry, drop wiper dart, and displace with fresh water and brine. This will bring the top of the First Stage cement to approximately 100' above the Stage Tool.
- 3. Bump wiper dart
- 4. Pressure up to approximately 2300 psi to set the External Casing Packer
- 5. Pressure up to approximately 2900 psi to open the Stage Tool
- 6. Circulate out the cement from above the Stage Tool
- 7. Pump the 2nd Stage Cement 13.6 ppg Lead Šlurry, with an option for 100 sacks 14.8 ppg Class C Neat Tail Slurry.
- 8. Displace the 2nd stage cement with a closing wiper plug and fresh water.
- 9. Bump the closing wiper plug
- 10. Pressure up to approximately 2600 psi to close the Stage Tool

Stage 1 Slurry:

35:65 Poz:Class H + 0.4% D65 Dispersant Mix Weight: 16.4 ppg Yield: 0.98 cu.ft. / sx Mix Water: 3.71 gal/sx Estimated volume is 550 sx but will be adjusted based on caliper if caliper log is available Planned bottom of Stage 1 Slurry: TD (approximately 4450' MD RKB) Planned / Estimated Top of Stage 1 Slurry: 3000' MD RKB.

Stage 2 Lead Slurry:

50:50 Poz:Class C + 5.0% D44 Salt (NaCl) (BWOW) + 0.25 lb/sx D29 Cellophane Flake Mix Weight : 13.6 ppg, Yield: 1.49 cuft/sx Mix Water: 7.39 gal/sx. Estimated volume is 750 sx but will be adjusted based on caliper if caliper log is available Planned / estimated bottom of Stage 2 Lead Slurry: 2750 - 3000' MD RKB Planned Top of Lead Slurry: Surface

Option for Stage 2 Tail Slurry

Class C Neat Mix Weight = 14.8 ppg Yield = 1.32 cuft /sx Mix Water = 6.31 gal/sx Estimated Volume is 100 sx but will be adjusted based on caliper if caliper log is available Planned / estimated bottom of Stage 2 Tail Slurry: 3000' MD RKB Planned Top of Lead Slurry: 2750' MD RKB
