Reserve Pit Remediation

Surface Pit Closure Plan

Pit Parameters

Well site: Mescalero 19 Fed #2 Legal Description: 1650' FSL & 990' FWL Section 19-19S-34E Lea County, New Mexico

The reserve pit insitu on this leasehold is being permitted to close as per New Mexico OCD "Pit and Below Grad Tank Guidelines" dates November 1, 2004.

This pit was excavated and formed to the dimensions roughly 100 feet X 100 feet x 6 feet deep. A 12 mil membrane liner and pad was used to prevent leakage to the surface soils. A visual examination of the membrane liner indicates that the liner has maintained its integrity.

The well bore penetrated a salt/anhydrite section causing the drilling fluid to saturate to a concentration weight of >9.5 ppg.

After drilling and completion phase of this project, the water phase of the pit contents were pumped and hauled to an approved water injection facility. The remaining solids were mechanically pulled to the corners of the containment area to allow them to dry and leach out as much liquid phase as possible. Again these liquids we hauled to an approved water injection facility. It is estimated that the volume of solids remaining are to +/- 1480 yards. The burial cell is to be excavated and lined with a minimum 20 mil membrane that complies with ASTM Standard(s): D 5747, D 5199, D 5994, and D 4833. The cuttings will be loaded as to allow for >36" freeboard to ground level. After the cuttings are

loaded, the 20 mil liner will be folded over the top and sewn on. A 20 mil minimum thickness liner meeting the minimum requirements as outlined in ASTM Standard Methods: D-5747, D-5199, D-5994, D4833; will be used to cap and cover to an extended area that exceeds three feet in all directions from the edge of the burial cell. This cap will be constructed as to slope and allow for water runoff from burial cell. A minimum of 36" of top soil will be used to cover the burial cell. This soil must be capable of supporting native plant growth. A seed mixture will be used as to conform to local BLM as well as New Mexico OCD requirements. The seeding and propagation of required native plants will be monitored as to insure that growth is re-established.

.. .

After the drilled solids are buried, the natural contour of the surrounding solids will be mechanically shaped as prevent erosion of the well site until vegetation is established. The caliches and soils will be pulled from the well site pad to allow for a 200 X 300 pad dimension for production use. The remaining materials will be used to maintain lease road and other drill sites.
