

VIII.

The Devonian formation from 11,019 to 11,430 will be the zone of water disposal. Lithology is a white to blue-white Cherty Dolomite with some secondary fracturing. The State "C" A/C 1 # 4 has 13-3/8" surface casing set at 275' to preserve fresh water aquifers found in the Ogallala formation. There is no known fresh water aquifers below the proposed water disposal zone in this area.
