RE: Federal G (SWD) #1-G
Sec 31, T9S R36E

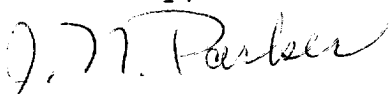

Dear Jerry:

In regards to your request of September 4, 1991 the following work was performed on this well to determine where the oil production is coming from and the condition of the well bore, tubing and casing strings.

1. A wire line feeler run was made on May 30, 1991 to check the tubing ID prior to running a temperature and velocity survey. The tubing was found to be scaled up inside.
2. The casing was tested on June 19, 1991 to 500 PSI O. K.
3. The tubing was pulled on June 20, 1991 and 1433' of tubing was replaced. The packer and casing was retested on May 21, 1991 to 500 PSI and tested O. K..
4. A differential temperature and fluid velocity survey was performed on June 24, 1991 which showed that the oil was entering the wellbore perforations at 12,017' to 12,036'.

If you have any questions or require additional information please call Donald Tyler at 915-523-7304 or write care of Union Oil Company of California, P. O. Box 1749, Andrews, TX 79714.

Sincerely,

J. N. Parker
