Typical Well Plugging Procedure
Sierra Blanca Orphan Wells

Basis of Plugging Design:

Review of the well files resulted in the following information about the condition of the wells and what is needed to properly plug them:

Surface casing: 7" – 10 ¾" set at approximately 300' and cemented with 150 sacks. Benterra has assumed that these casing strings were cemented all the way to surface. Not all of the well files contained this information, but many did confirm that cement was circulated.

Base of Fresh Water: Paul Kautz advised that the base of fresh water was at approximately 300' in this area. Benterra has assumed that the base of fresh water is at the surface casing setting depth or at a minimum of 250'.

Production Casing: 4 ½" to 7" set at approximately 3000' and cemented with 600 sacks. The top of cement was recorded on only a very few wells; however, many permits contained the requirement that the casing strings be cemented through the top of the salt section, which occurs at approximately 1500' in this area. Several temperature surveys were run and confirmed this. Benterra has assumed that all of the production casing strings are adequately cemented at least through the salt section as the OCD required at the time they were drilled.

Typical Plugging Procedure

Make sinker bar run to check for obstructions and TD
Displace or circulate wellbore with fresh water
Surface pour a bentonite plug from TD to at least 100' above the production casing shoe or top perforation
RIH with a wiper plug and set 50' below top of salt
Surface pour a bentonite plug from 50' below to at least 50' above the top of salt
RIH with wireline and perforate 50' below the surface casing shoe (minimum perf depth is 300')
RU cementer and squeeze/circulate cement from surface down production casing to provide for a 100' min plug behind the production casing
Leave production casing full of cement to surface and shut in
Dig out and cut off wellhead and install dry hole marker
Pack annulus with bentonite
Attempt to locate and cut off deadmen
Clean up location including any **above-ground** cement foundations
