1. The first step in the process of the scientific method is to ask a question. This question should be based on observation and should be something that can be tested. For example, "Does the amount of water affect the growth of plants?"

2. The second step is to do background research. This involves finding out what is already known about the topic. For example, "How much water do plants need to grow?"

3. The third step is to form a hypothesis. This is a statement that can be tested. For example, "If I give a plant more water, then it will grow taller." •
