- A packer leakage test shall be connecced the wall, and annually eafter as prescribed by the order authorizing the wall, and annually tests shall also be commenced on all multiple completions within seven following recompletions and/or chemical or fracture treatment, and when remodial work has been done on a well during which the parker or the reaction is suspected or when requested by the Coralission.
- At least 72 hours prior to the consequence of any packer leakage test, operator shall notify the Commission in writing of the exact time the tis to be commoned. Offset operators shall also be so notified.

  The packer leakage test shall commonce when both zones of the dual letion are shut-in for pressure stabilization. Both zones shall remain of two hours thereafter, provided however, that they need not remain in more than 24 hours.
- For Flow Test No. 1, one zone of the dual completion shall be produced the normal rate of production while the other zone remains shut-in. Such it shall be continued until the flowing wallhead pressure has become bilized and for a minimum of two hours thereafter, provided however, it the flow test need not continue for more than 24 hours.
- all be conducted even though no leak was indicated in Procedure for hims less S: 2 is to be the saze I except that the previously produced zone shall respectively shall not be previously shall not b
- 7. All pressures, throughout the outine test, shall be continuously measure and in order with recording pressure gauges, the accuracy of which must be checked with a deadabaght tester at least trace, once at the beginning and case at the end, or each flow test?
- beginning and case at the end, of each flow test?

  8. The results of the above-described tests stall be filled in triplicate atthin 15 days after completion of the test. Tests shall be filled with the appropriate District Office of the No. Revice Oil Committee Commission on Southeast New Pexico Packer Leaking Test Form Reviced 11-1-50, deadwright pressures which were taken indicated thereon. In lieu of filling the afordsaid charts, the operator may construct a pressure versus time curve for each zone of each test, indicating thereon all pressure changes which were taken. If the pressure and as all deadwards which may be reflected by the gauge charts as well as all deadwight pressure readings which were taken. If the pressure curve is submitted, the original chart must be permanently filed in the operator's office. Form C-116 shall also accompany the Facker Leaking Test Form when the test period coincides with a gas-oil ratio test period.
