(Field)

(County or Subdivision)

(State or Territory)

The elevation of the derrick floor above sea level is 3889 ft.

DETAILS OF WORK

(State names of and expected depths to objective sands; show sizes, weights, and lengths of proposed casings; indicate mudding jobs, cementing jobs, and all other important proposed work.)

This well was originally drilled through the Maljamar Pay to total depth of 4300' in July 1954. 5-1/8" casing was set @ 4275' & cement circulated to surface behind casing. Cement inside casing is below the Maljamar Pay at approximately 4239'. Casing was perforated into the Red Sand Zone from 3853' to 3862' and 3872' to 3884' & well was sand-oil treated. Since this time well has produced from the Red Sand Zone but production has now declined to the point (1 MOPD) where it is not economically practicable to continue producing from the Red Sand Zone.

We now propose to recomplete this well in the Maljamar Pay by spacing off the Red Sand Zone perforations, clean out well to top of cement plug, perforate casing in the Maljamar Pay and sand-oil treat with 20,000 gals. gelled lease crude & 20,000 sand, & place well on production.

This recompletion has been approved by letter from Mr. A. L. Porter, Jr. of the New Mexico Oil Conservation Commission.

I understand that this plan of work must receive approval in writing by the Geological Survey before operations may be commenced.

A complete supplemental well history will be furnished on completion of work.
