Present total depth in this well is 7995', and production is coming from tubb zone perforations at 7540-70'. We propose to plug the well back to 6100', perforate casing at 6385' and squeeze cement opposite the Paddock zone. We, then, plan to perforate the casing opposite the Paddock zone and test the section to determine whether oil or gas is present in commercial quantities. If commercial production is present, we plan to complete in the Paddock section and, with the Commission's approval, produce from the zone.
