Figure 1. The proposed model for the development of the *Staphylococcus aureus* infection in the skin of the patient with the skin disease. The model shows the interaction between the skin disease, the immune system, and the *S. aureus* bacteria. The skin disease leads to the development of the infection, which is then exacerbated by the immune system. The immune system also leads to the development of the infection, which is then exacerbated by the skin disease. The skin disease and the immune system both lead to the development of the infection, which is then exacerbated by the skin disease and the immune system.
