Unit Letter "A"
660 feet FNL X 660 feet FEL
Section 11, T18S, R36E

MNA proposes to re-enter the wellbore of the San Andres test of Cactus Drilling Company that was plugged and abandoned in 1965. Pulling unit and reverse rig will be used to drill out cement plugs and restore 5 1/2" casing integrity down to the bottom of the 5 1/2" casing at 5115 feet. If no plugs are encountered below the bottom plug set from 4450 feet down to 4660 feet. A cast iron bridge plug will be set at 5100 feet and capped with 35 feet of cement to isolate the old open hole completion in the San Andres for a commercial test of the Queen.

Mud Program: If 5 1/2" casing is found in the top part of the wellbore, 2% KCL water will be used to drill out plugs. If there is no 5 1/2" casing down to calculated cement top of 2100 feet, then brine will be used through the salt section.

BOP Program: A 13 3/8" 3000 psi well head will be welded to 13 3/8" casing stub at the surface. It will be equipped with 2 - 2" outlets for well control. Appropriated BOP will be installed and tested during drill out operations.
