Dear Sir:

According to your instructions, I wish to submit the following bottom hole pressure data from Southern Petroleum Exploration Company's Morris A #1. The well was shut in 24 hours prior to test. Static pressure was run and left on bottom 1 hour. The well was then opened on an approximate 1 inch choke and produced at the rate of $2\frac{1}{2}$ barrels per hour from the zone behind 5 inch liner and inside 7 inch casing. During the flow period there was no drop in bottom hole pressure throughout the four hour test.

Yours very truly,

Charles R. Beal
