New York

The elevation of the derrick floor above sea level is 3655 ft.

DETAILS OF WORK

(State names of an expected depths to objective sand zones, sizes, weights, and thicknesses of casing, and all other pertinent points, and all other pertinent points.)

To shut off or reduce water production by plugging off highly permeable zone at 4164-4169' with plastic. If excessive water production still exists, the plug will be extended above a second permeable zone located at 4144-4149'. If packer tests indicate this should appreciably reduce water production, a light acid treatment of the remaining hole may be necessary to stimulate production.

(Understand that this plan of work must receive approval in writing by the Director.)
