This well at its present depth of 4180 has penetrated an excessive thickness of sandy lime overlying the regular producing horizon. Because of the possibility of encountering water when the regular producing formation is penetrated it was deemed advisable to test the several small shows of oil located between 4014 and 4180. The test produced at a rate of 4 bbs oil per hour swabbing. To ascertain whether it is possible to obtain a well by acid treatment it is proposed to acidize w/2000 gallons acid.
